### Release Information

The following releases of this document have been made.

**Release history**

| Date | Issue | Confidentiality | Change |
|---|---|---|---|
| 30 April 2013 | A.a-1 | Confidential-Beta Draft | Beta draft of first issue, limited circulation |
| 12 June 2013 | A.a-2 | Confidential-Beta Draft | Second beta draft of first issue, limited circulation |
| 04 September 2013 | A.a | Non-Confidential Beta | Beta release. |
| 24 December 2013 | A.b | Non-Confidential Beta | Second beta release. |
| 18 July 2014 | A.c | Non-Confidential Beta | Third beta release. |
| 09 October 2014 | A.d | Non-Confidential Beta | Fourth beta release. |
| 17 December 2014 | A.e | Non-Confidential Beta | Fifth beta release. |
| 25 March 2015 | A.f | Non-Confidential Beta | Sixth beta release. |
| 10 July 2015 | A.g | Non-Confidential Beta | Seventh beta release. |
| 30 September 2015 | A.h | Non-Confidential Beta | Eighth beta release. |

LES-PRE-20327

In this document, where the term ARM is used to refer to the company it means “ARM or any of its subsidiaries as appropriate”.

**Note**

- The term ARM can refer to versions of the ARM architecture, for example ARMv8 refers to version 8 of the ARM architecture. The context makes it clear when the term is used in this way.
- This document describes only the ARMv8-A architecture profile. For the behaviors required by the ARMv7-A and ARMv7-R architecture profiles, see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

### *Status and limitations of issue A.h*

This issue A.h of the ARMv8 Architecture Reference Manual contains many improvements and corrections. However, as indicated by its overall beta status, it remains work-in-progress. ARM is aware of the following issues that will be addressed in the next issue:

- Compared to issue A.g:
  - We are in the process of improving the introductory descriptions of the A64 instructions in Chapter C7 *A64 Advanced SIMD and Floating-point Instruction Descriptions*. However, this work is incomplete and many instructions still have only a minimal introduction.
  - We are in the process of replacing pseudocode inserts in parts B to I of the manual with links to the appropriate functions in Chapter J1 *ARMv8 Pseudocode*. This work is incomplete.

    **Note**

    Chapter J1 was previously an Appendix.

  - Appendix K11 *ARM Pseudocode Definition* has been updated and restructured extensively, to describe the ARMv8 version of the ARM pseudocode. These changes have had very limited review.
- We are working to improve the descriptions of register reset behavior in the register descriptions throughout this manual. This remains work-in-progress for the debug System registers and memory-mapped registers.

  **Note**

  Except for non-debug System registers, the register descriptions might not give a clear indication of when any stated reset values apply.
- There have been additions to the Performance Monitors Extension described in Chapter D5 *The Performance Monitors Extension*. These additions include the definition of additional events, described in Chapter D5, and additional recommended IMPLEMENTATION DEFINED events, described in Appendix K3 *Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events*. These additions have had only very limited review.

# Contents
# ARM Architecture Reference Manual ARMv8, for ARMv8-A architecture profile

**Preface**
About this manual ..... xvi
Using this manual ..... xviii
Conventions ..... xxiii
Additional reading ..... xxv
Feedback ..... xxvi

## Part A ARMv8 Architecture Introduction and Overview

**Chapter A1 Introduction to the ARMv8 Architecture**
A1.1 About the ARM architecture ..... A1-30
A1.2 Architecture profiles ..... A1-32
A1.3 ARMv8 architectural concepts ..... A1-33
A1.4 Supported data types ..... A1-36
A1.5 Floating-point and Advanced SIMD support ..... A1-46
A1.6 Cryptographic Extension ..... A1-52
A1.7 The ARM memory model ..... A1-53

## Part B The AArch64 Application Level Architecture

**Chapter B1 The AArch64 Application Level Programmers' Model**
B1.1 About the Application level programmers' model ..... B1-58
B1.2 Registers in AArch64 Execution state ..... B1-59
B1.3 Software control features and EL0 ..... B1-64

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Chapter B2** **The AArch64 Application Level Memory Model**
B2.1 Address space ... B2-68
B2.2 Memory type overview ... B2-69
B2.3 Caches and memory hierarchy ... B2-70
B2.4 Alignment support ... B2-75
B2.5 Endian support ... B2-77
B2.6 Atomicity in the ARM architecture ... B2-80
B2.7 Memory ordering ... B2-83
B2.8 Memory types and attributes ... B2-93
B2.9 Mismatched memory attributes ... B2-104
B2.10 Synchronization and semaphores ... B2-107

**Part C** **The AArch64 Instruction Set**

**Chapter C1** **The A64 Instruction Set**
C1.1 Introduction ... C1-120
C1.2 Structure of the A64 assembler language ... C1-121
C1.3 Address generation ... C1-126
C1.4 Instruction aliases ... C1-129

**Chapter C2** **About the A64 Instruction Descriptions**
C2.1 Understanding the A64 instruction descriptions ... C2-132
C2.2 Conventions used in AArch64 instruction and System register descriptions ... C2-135

**Chapter C3** **A64 Instruction Set Overview**
C3.1 Branches, Exception generating, and System instructions ... C3-138
C3.2 Loads and stores ... C3-142
C3.3 Data processing - immediate ... C3-153
C3.4 Data processing - register ... C3-158
C3.5 Data processing - SIMD and floating-point ... C3-165

**Chapter C4** **A64 Instruction Set Encoding**
C4.1 A64 instruction index by encoding ... C4-186
C4.2 Data processing - immediate ... C4-187
C4.3 Branches, exception generating and system instructions ... C4-191
C4.4 Loads and stores ... C4-196
C4.5 Data processing - register ... C4-218
C4.6 Data processing - SIMD and floating point ... C4-227

**Chapter C5** **The A64 System Instruction Class**
C5.1 The System instruction class encoding space ... C5-266
C5.2 Special-purpose registers ... C5-289
C5.3 A64 system instructions for cache maintenance ... C5-342
C5.4 A64 system instructions for address translation ... C5-358
C5.5 A64 system instructions for TLB maintenance ... C5-371

**Chapter C6** **A64 Base Instruction Descriptions**
C6.1 Introduction ... C6-426
C6.2 Register size ... C6-427
C6.3 Use of the PC ... C6-428
C6.4 Use of the stack pointer ... C6-429
C6.5 Condition flags and related instructions ... C6-430
C6.6 Alphabetical list of instructions ... C6-431

**Chapter C7** **A64 Advanced SIMD and Floating-point Instruction Descriptions**
C7.1 Introduction ... C7-836

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

C7.2 About the SIMD and floating-point instructions ..... C7-837
C7.3 Alphabetical list of floating-point and Advanced SIMD instructions ..... C7-839

# Part D The AArch64 System Level Architecture

## Chapter D1 The AArch64 System Level Programmers' Model

D1.1 Exception levels ..... D1-1514
D1.2 Exception terminology ..... D1-1515
D1.3 Execution state ..... D1-1517
D1.4 Security state ..... D1-1518
D1.5 Virtualization ..... D1-1520
D1.6 Registers for instruction processing and exception handling ..... D1-1523
D1.7 Process state, PSTATE ..... D1-1529
D1.8 Program counter and stack pointer alignment ..... D1-1531
D1.9 Reset ..... D1-1533
D1.10 Exception entry ..... D1-1537
D1.11 Exception return ..... D1-1552
D1.12 The Exception level hierarchy ..... D1-1556
D1.13 Synchronous exception types, routing and priorities ..... D1-1563
D1.14 Asynchronous exception types, routing, masking and priorities ..... D1-1569
D1.15 Configurable instruction enables and disables, and trap controls ..... D1-1575
D1.16 System calls ..... D1-1610
D1.17 Mechanisms for entering a low-power state ..... D1-1611
D1.18 Self-hosted debug ..... D1-1616
D1.19 The Performance Monitors Extension ..... D1-1618
D1.20 Interprocessing ..... D1-1619
D1.21 The effect of implementation choices on the programmers' model ..... D1-1631

## Chapter D2 AArch64 Self-hosted Debug

D2.1 About debug exceptions ..... D2-1637
D2.2 The debug exception enable controls ..... D2-1640
D2.3 Routing debug exceptions ..... D2-1641
D2.4 Enabling debug exceptions from the current Exception level and Security state ..... D2-1643
D2.5 The effect of powerdown on debug exceptions ..... D2-1645
D2.6 Summary of the routing and enabling of debug exceptions ..... D2-1646
D2.7 Pseudocode description of debug exceptions ..... D2-1648
D2.8 Software Breakpoint Instruction exceptions ..... D2-1650
D2.9 Breakpoint exceptions ..... D2-1653
D2.10 Watchpoint exceptions ..... D2-1671
D2.11 Vector Catch exceptions ..... D2-1685
D2.12 Software Step exceptions ..... D2-1686
D2.13 Synchronization and debug exceptions ..... D2-1701

## Chapter D3 The AArch64 System Level Memory Model

D3.1 About the memory system architecture ..... D3-1704
D3.2 Address space ..... D3-1705
D3.3 Mixed-endian support ..... D3-1706
D3.4 Cache support ..... D3-1707
D3.5 External aborts ..... D3-1727
D3.6 Memory barrier instructions ..... D3-1729
D3.7 Pseudocode description of general memory system instructions ..... D3-1730

## Chapter D4 The AArch64 Virtual Memory System Architecture

D4.1 About the Virtual Memory System Architecture (VMSA) ..... D4-1742
D4.2 The VMSAv8-64 address translation system ..... D4-1745
D4.3 VMSAv8-64 translation table format descriptors ..... D4-1799

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

D4.4 Access controls and memory region attributes ..... D4-1808
D4.5 MMU faults ..... D4-1824
D4.6 Translation Lookaside Buffers (TLBs) ..... D4-1833
D4.7 TLB maintenance requirements and the TLB maintenance instructions ..... D4-1837
D4.8 Caches in a VMSA implementation ..... D4-1850

**Chapter D5 The Performance Monitors Extension**
D5.1 About the Performance Monitors ..... D5-1856
D5.2 Accuracy of the Performance Monitors ..... D5-1859
D5.3 Behavior on overflow ..... D5-1861
D5.4 Attributability ..... D5-1863
D5.5 Effect of EL3 and EL2 ..... D5-1864
D5.6 Event filtering ..... D5-1866
D5.7 Performance Monitors and Debug state ..... D5-1868
D5.8 Counter enables ..... D5-1869
D5.9 Counter access ..... D5-1870
D5.10 Events, Event numbers and mnemonics ..... D5-1872
D5.11 Performance Monitors Extension registers ..... D5-1893

**Chapter D6 The Generic Timer in AArch64 state**
D6.1 About the Generic Timer in AArch64 state ..... D6-1898

**Chapter D7 AArch64 System Register Descriptions**
D7.1 About the AArch64 System registers ..... D7-1908
D7.2 General system control registers ..... D7-1913
D7.3 Debug registers ..... D7-2165
D7.4 Performance Monitors registers ..... D7-2236
D7.5 Generic Timer registers ..... D7-2276

**Part E The AArch32 Application Level Architecture**

**Chapter E1 The AArch32 Application Level Programmers' Model**
E1.1 About the Application level programmers' model ..... E1-2310
E1.2 Additional information about the programmers' model in AArch32 state ..... E1-2311
E1.3 Advanced SIMD and floating-point instructions ..... E1-2325
E1.4 Conceptual coprocessor support ..... E1-2353
E1.5 Exceptions ..... E1-2354

**Chapter E2 The AArch32 Application Level Memory Model**
E2.1 Address space ..... E2-2356
E2.2 Memory type overview ..... E2-2357
E2.3 Caches and memory hierarchy ..... E2-2358
E2.4 Alignment support ..... E2-2363
E2.5 Endian support ..... E2-2365
E2.6 Atomicity in the ARM architecture ..... E2-2368
E2.7 Memory ordering ..... E2-2372
E2.8 Memory types and attributes ..... E2-2382
E2.9 Mismatched memory attributes ..... E2-2392
E2.10 Synchronization and semaphores ..... E2-2395

**Part F The AArch32 Instruction Sets**

**Chapter F1 The AArch32 Instruction Sets Overview**
F1.1 Support for instructions in different versions of the ARM architecture ..... F1-2408
F1.2 Unified Assembler Language ..... F1-2409
F1.3 Branch instructions ..... F1-2411

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

F1.4 Data-processing instructions ..... F1-2412
F1.5 PSTATE and banked register access instructions ..... F1-2420
F1.6 Load/store instructions ..... F1-2421
F1.7 Load/store multiple instructions ..... F1-2424
F1.8 Miscellaneous instructions ..... F1-2425
F1.9 Exception-generating and exception-handling instructions ..... F1-2426
F1.10 Coprocessor instructions ..... F1-2427
F1.11 Advanced SIMD and floating-point load/store instructions ..... F1-2428
F1.12 Advanced SIMD and floating-point register transfer instructions ..... F1-2430
F1.13 Advanced SIMD data-processing instructions ..... F1-2431
F1.14 Floating-point data-processing instructions ..... F1-2439

**Chapter F2 About the T32 and A32 Instruction Descriptions**
F2.1 Format of instruction descriptions ..... F2-2442
F2.2 Standard assembler syntax fields ..... F2-2446
F2.3 Conditional execution ..... F2-2447
F2.4 Shifts applied to a register ..... F2-2449
F2.5 Memory accesses ..... F2-2452
F2.6 Encoding of lists of general-purpose registers and the PC ..... F2-2453
F2.7 About the T32 and A32 instruction encodings ..... F2-2454
F2.8 Additional pseudocode support for instruction descriptions ..... F2-2461

**Chapter F3 T32 Base Instruction Set Encoding**
F3.1 Top level T32 instruction set encoding ..... F3-2464
F3.2 16-bit T32 instruction encoding ..... F3-2465
F3.3 32-bit T32 instruction encoding ..... F3-2476

**Chapter F4 A32 Base Instruction Set Encoding**
F4.1 Top level A32 instruction set encoding ..... F4-2508
F4.2 Data-processing and miscellaneous instructions ..... F4-2509
F4.3 Load/Store Word, Unsigned Byte (immediate, literal) ..... F4-2525
F4.4 Load/Store Word, Unsigned Byte (register) ..... F4-2526
F4.5 Media instructions ..... F4-2527
F4.6 Branch, branch with link, and block data transfer ..... F4-2535
F4.7 Coprocessor instructions, and Supervisor Call ..... F4-2537
F4.8 Unconditional instructions ..... F4-2541

**Chapter F5 T32 and A32 Instruction Sets Advanced SIMD and floating-point Encodings**
F5.1 Overview ..... F5-2546
F5.2 Advanced SIMD and floating-point instruction syntax ..... F5-2547
F5.3 Register encoding ..... F5-2551
F5.4 Advanced SIMD data-processing instructions ..... F5-2553
F5.5 Floating-point data-processing instructions ..... F5-2565
F5.6 Advanced SIMD and floating-point register load/store instructions ..... F5-2568
F5.7 Advanced SIMD element or structure load/store instructions ..... F5-2569
F5.8 8, 16, and 32-bit transfers accessing the SIMD and floating-point register file F5-2572
F5.9 64-bit transfers accessing the SIMD and floating-point register file ..... F5-2573

**Chapter F6 T32 and A32 Base Instruction Set Instruction Descriptions**
F6.1 Alphabetical list of T32 and A32 base instruction set instructions ..... F6-2576
F6.2 Encoding and use of Banked register transfer instructions ..... F6-3202

**Chapter F7 T32 and A32 Advanced SIMD and floating-point Instruction Descriptions**
F7.1 Alphabetical list of floating-point and Advanced SIMD instructions ..... F7-3208

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

# Part G The AArch32 System Level Architecture

## Chapter G1 The AArch32 System Level Programmers' Model

G1.1 About the AArch32 System level programmers' model ..... G1-3746
G1.2 Exception levels ..... G1-3747
G1.3 Exception terminology ..... G1-3748
G1.4 Execution state ..... G1-3750
G1.5 Instruction Set state ..... G1-3752
G1.6 Security state ..... G1-3753
G1.7 Virtualization ..... G1-3756
G1.8 AArch32 PE modes, and general-purpose and Special-purpose registers ..... G1-3758
G1.9 Process state, PSTATE ..... G1-3767
G1.10 Instruction set states ..... G1-3772
G1.11 Handling exceptions that are taken to an Exception level using AArch32 ..... G1-3774
G1.12 Exception return to an Exception level using AArch32 ..... G1-3796
G1.13 Asynchronous exception behavior for exceptions taken from AArch32 state . G1-3801
G1.14 AArch32 state exception descriptions ..... G1-3811
G1.15 Reset into AArch32 state ..... G1-3830
G1.16 Mechanisms for entering a low-power state ..... G1-3834
G1.17 The conceptual coprocessor interface and system control ..... G1-3839
G1.18 Advanced SIMD and floating-point support ..... G1-3841
G1.19 Configurable instruction enables and disables, and trap controls ..... G1-3846

## Chapter G2 AArch32 Self-hosted Debug

G2.1 About debug exceptions ..... G2-3883
G2.2 The debug exception enable controls ..... G2-3886
G2.3 Routing debug exceptions ..... G2-3887
G2.4 Enabling debug exceptions from the current Privilege level and Security state ..... G2-3889
G2.5 The effect of powerdown on debug exceptions ..... G2-3891
G2.6 Summary of permitted routing and enabling of debug exceptions ..... G2-3892
G2.7 Pseudocode description of debug exceptions ..... G2-3894
G2.8 Software Breakpoint Instruction exceptions ..... G2-3895
G2.9 Breakpoint exceptions ..... G2-3898
G2.10 Watchpoint exceptions ..... G2-3923
G2.11 Vector Catch exceptions ..... G2-3937
G2.12 Synchronization and debug exceptions ..... G2-3945

## Chapter G3 The AArch32 System Level Memory Model

G3.1 About the memory system architecture ..... G3-3948
G3.2 Address space ..... G3-3949
G3.3 Mixed-endian support ..... G3-3950
G3.4 AArch32 cache and branch predictor support ..... G3-3952
G3.5 System register support for IMPLEMENTATION DEFINED memory features G3-3975
G3.6 External aborts ..... G3-3976
G3.7 Memory barrier instructions ..... G3-3978
G3.8 Pseudocode description of general memory system instructions ..... G3-3979

## Chapter G4 The AArch32 Virtual Memory System Architecture

G4.1 Execution privilege, Exception levels, and AArch32 Privilege levels ..... G4-3990
G4.2 About VMSAv8-32 ..... G4-3992
G4.3 The effects of disabling address translation stages on VMSAv8-32 behavior G4-4000
G4.4 Translation tables ..... G4-4004
G4.5 The VMSAv8-32 Short-descriptor translation table format ..... G4-4009
G4.6 The VMSAv8-32 Long-descriptor translation table format ..... G4-4018
G4.7 Memory access control ..... G4-4037
G4.8 Memory region attributes ..... G4-4046
G4.9 Translation Lookaside Buffers (TLBs) ..... G4-4058

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

G4.10 TLB maintenance requirements ..... G4-4061
G4.11 Caches in VMSAv8-32 ..... G4-4074
G4.12 VMSAv8-32 memory aborts ..... G4-4078
G4.13 Exception reporting in a VMSAv8-32 implementation ..... G4-4091
G4.14 Address translation instructions ..... G4-4110
G4.15 About the System registers for VMSAv8-32 ..... G4-4116
G4.16 Organization of the CP14 registers in VMSAv8-32 ..... G4-4138
G4.17 Organization of the CP15 registers in VMSAv8-32 ..... G4-4141
G4.18 Functional grouping of VMSAv8-32 System registers ..... G4-4161
G4.19 Pseudocode description of VMSAv8-32 memory system operations ..... G4-4183

**Chapter G5 The Generic Timer in AArch32 state**
G5.1 About the Generic Timer in AArch32 state ..... G5-4202

**Chapter G6 AArch32 System Register Descriptions**
G6.1 About the AArch32 System registers ..... G6-4212
G6.2 General system control registers ..... G6-4213
G6.3 Debug registers ..... G6-4648
G6.4 Performance Monitors registers ..... G6-4737
G6.5 Generic Timer registers ..... G6-4780

## Part H External Debug

**Chapter H1 Introduction to External Debug**
H1.1 Introduction to external debug ..... H1-4816
H1.2 External debug ..... H1-4817

**Chapter H2 Debug State**
H2.1 About Debug state ..... H2-4820
H2.2 Halting the PE on debug events ..... H2-4821
H2.3 Entering Debug state ..... H2-4828
H2.4 Behavior in Debug state ..... H2-4832
H2.5 Exiting Debug state ..... H2-4858

**Chapter H3 Halting Debug Events**
H3.1 Introduction to Halting debug events ..... H3-4862
H3.2 Halting Step debug events ..... H3-4864
H3.3 Halt Instruction debug event ..... H3-4874
H3.4 Exception Catch debug event ..... H3-4875
H3.5 External Debug Request debug event ..... H3-4878
H3.6 OS Unlock Catch debug event ..... H3-4879
H3.7 Reset Catch debug events ..... H3-4880
H3.8 Software Access debug event ..... H3-4881
H3.9 Synchronization and Halting debug events ..... H3-4882

**Chapter H4 The Debug Communication Channel and Instruction Transfer Register**
H4.1 Introduction ..... H4-4886
H4.2 DCC and ITR registers ..... H4-4887
H4.3 DCC and ITR access modes ..... H4-4889
H4.4 Flow control of the DCC and ITR registers ..... H4-4893
H4.5 Synchronization of DCC and ITR accesses ..... H4-4897
H4.6 Interrupt-driven use of the DCC ..... H4-4902
H4.7 Pseudocode description of the operation of the DCC and ITR registers ..... H4-4903

**Chapter H5 The Embedded Cross-Trigger Interface**
H5.1 About the Embedded Cross-Trigger (ECT) ..... H5-4908
H5.2 Basic operation on the ECT ..... H5-4910

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

H5.3 Cross-triggers on a PE in an ARMv8 implementation ..... H5-4914
H5.4 Description and allocation of CTI triggers ..... H5-4915
H5.5 CTI registers programmers' model ..... H5-4919
H5.6 Examples ..... H5-4920

**Chapter H6 Debug Reset and Powerdown Support**
H6.1 About Debug over powerdown ..... H6-4924
H6.2 Power domains and debug ..... H6-4925
H6.3 Core power domain power states ..... H6-4926
H6.4 Emulating low-power states ..... H6-4928
H6.5 Debug OS Save and Restore sequences ..... H6-4930
H6.6 Reset and debug ..... H6-4935

**Chapter H7 The Sample-based Profiling Extension**
H7.1 Sample-based profiling ..... H7-4938

**Chapter H8 About the External Debug Registers**
H8.1 Relationship between external debug and System registers ..... H8-4944
H8.2 Supported access sizes ..... H8-4945
H8.3 Synchronization of changes to the external debug registers ..... H8-4946
H8.4 Memory-mapped accesses to the external debug interface ..... H8-4950
H8.5 External debug interface register access permissions ..... H8-4952
H8.6 External debug interface registers ..... H8-4956
H8.7 Cross-trigger interface registers ..... H8-4961
H8.8 External debug register resets ..... H8-4963

**Chapter H9 External Debug Register Descriptions**
H9.1 Introduction ..... H9-4966
H9.2 Debug registers ..... H9-4967
H9.3 Cross-Trigger Interface registers ..... H9-5054

**Part I Memory-mapped Components of the ARMv8 Architecture**

**Chapter I1 System Level Implementation of the Generic Timer**
I1.1 About the Generic Timer specification ..... I1-5098
I1.2 Memory-mapped counter module ..... I1-5099
I1.3 Counter module control and status register summary ..... I1-5102
I1.4 Memory-mapped timer components ..... I1-5104
I1.5 The CNTBaseN and CNTEL0BaseN frames ..... I1-5105
I1.6 The CNTCTLBase frame ..... I1-5107
I1.7 Providing a complete set of counter and timer features ..... I1-5108
I1.8 Gray-count scheme for timer distribution scheme ..... I1-5110

**Chapter I2 Recommended Memory-mapped Interfaces to the Performance Monitors**
I2.1 About the memory-mapped views of the Performance Monitors registers ..... I2-5112

**Chapter I3 Memory-Mapped System Control Register Descriptions**
I3.1 About the memory-mapped system control register descriptions ..... I3-5118
I3.2 Performance Monitors memory-mapped registers summary ..... I3-5119
I3.3 Performance Monitors memory-mapped register descriptions ..... I3-5121
I3.4 Generic Timer memory-mapped registers overview ..... I3-5172
I3.5 Generic Timer memory-mapped register descriptions ..... I3-5173

# Part J Architectural Pseudocode

## Chapter J1 ARMv8 Pseudocode

J1.1 Pseudocode for AArch64 operations ..... J1-5214
J1.2 Pseudocode for AArch32 operation ..... J1-5273
J1.3 Shared pseudocode ..... J1-5344

# Part K Appendixes

## Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors

K1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors ..... K1-5422
K1.2 Constraints on AArch64 state UNPREDICTABLE behaviors ..... K1-5501

## Appendix K2 Recommended External Debug Interface

K2.1 About the recommended external debug interface ..... K2-5516
K2.2 PMUEVENT bus ..... K2-5519
K2.3 Recommended authentication interface ..... K2-5520
K2.4 Management registers and CoreSight compliance ..... K2-5523

## Appendix K3 Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events

K3.1 ARM recommendations for IMPLEMENTATION DEFINED event numbers ... K3-5530
K3.2 Summary of events for exceptions taken to an Exception Level using AArch64 ..... K3-5544

## Appendix K4 Recommendations for reporting memory attributes on an interconnect

K4.1 ARM recommendations for reporting memory attributes on an interconnect .. K4-5548

## Appendix K5 ARMv8 Changes to the T32 and A32 Instruction Sets

K5.1 The A32 and T32 instruction sets ..... K5-5550
K5.2 Partial deprecation of IT ..... K5-5551
K5.3 New A32 and T32 Load-Acquire/Store-Release instructions ..... K5-5552
K5.4 New A32 and T32 scalar floating-point instructions ..... K5-5553
K5.5 New A32 and T32 Advanced SIMD floating-point instructions ..... K5-5556
K5.6 New A32 and T32 instructions provided by the Cryptographic Extension ..... K5-5558
K5.7 New A32 and T32 System instructions ..... K5-5559
K5.8 CRC32 instructions ..... K5-5561

## Appendix K6 Legacy Instruction Syntax for AArch32 Instruction Sets

K6.1 Legacy Instruction Syntax ..... K6-5564

## Appendix K7 Address translation examples

K7.1 AArch64 Address translation examples ..... K7-5572
K7.2 AArch32 Address translation examples ..... K7-5585

## Appendix K8 Example OS Save and Restore Sequences

K8.1 Save Debug registers ..... K8-5596
K8.2 Restore Debug registers ..... K8-5598

## Appendix K9 Recommended Upload and Download Processes for External Debug

K9.1 Using memory access mode in AArch64 state ..... K9-5602

## Appendix K10 Barrier Litmus Tests

K10.1 Introduction ..... K10-5606
K10.2 Load-Acquire, Store-Release and barriers ..... K10-5609

# Preface

This preface introduces the *ARM Architecture Reference Manual, ARMv8, for ARMv8-A architecture profile*. It contains the following sections:

- *About this manual* on page xvi.
- *Using this manual* on page xviii.
- *Conventions* on page xxiii.
- *Additional reading* on page xxv.
- *Feedback* on page xxvi.

**Note**

This document describes only the ARMv8-A architecture profile. For the behaviors required by the ARMv7-A and ARMv7-R architecture profiles, see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## About this manual

This manual describes the ARM® architecture v8, ARMv8. The architecture describes the operation of an ARMv8-A *Processing element (PE)*, and this manual includes descriptions of:

- The two Execution states, AArch64 and AArch32.
- The instruction sets:
  - In AArch32 state, the A32 and T32 instruction sets, that are compatible with earlier versions of the ARM architecture.
  - In AArch64 state, the A64 instruction set.
- The states that determine how a PE operates, including the current Exception level and Security state, and in AArch32 state the PE mode.
- The Exception model.
- The interprocessing model, that supports transitioning between AArch64 state and AArch32 state.
- The memory model, that defines memory ordering and memory management. This manual covers a single architecture profile, ARMv8-A, that defines a *Virtual Memory System Architecture* (VMSA).
- The programmers' model, and its interfaces to System registers that control most PE and memory system features, and provide status information.
- The Advanced SIMD and floating-point instructions, that provide high-performance:
  - Single-precision and double-precision floating-point operations.
  - Conversions between double-precision, single-precision, and half-precision floating-point values.
  - Integer, single-precision floating-point, and in A64, double-precision vector operations in all instruction sets.
  - Double-precision floating-point vector operations in the A64 instruction set.
- The security model, that provides two security states to support secure applications.
- The virtualization model, that support the virtualization of Non-secure operation.
- The Debug architecture, that provides software access to debug features.

This manual gives the assembler syntax for the instructions it describes, meaning that it describes instructions in textual form. However, this manual is not a tutorial for ARM assembler language, nor does it describe ARM assembler language, except at a very basic level. To make effective use of ARM assembler language, read the documentation supplied with the assembler being used.

This manual is organized into parts:

**Part A** Provides an introduction to the ARMv8-A architecture, and an overview of the AArch64 and AArch32 Execution states.

**Part B** Describes the application level view of the AArch64 Execution state, meaning the view from EL0. It describes the application level view of the programmers' model and the memory model.

**Part C** Describes the A64 instruction set, that is available in the AArch64 Execution state. The descriptions for each instruction also include the precise effects of each instruction when executed at EL0, described as *unprivileged* execution, including any restrictions on its use, and how the effects of the instruction differ at higher Exception levels. This information is of primary importance to authors and users of compilers, assemblers, and other programs that generate ARM machine code.

**Part D** Describes the system level view of the AArch64 Execution state. It includes details of the System registers, most of which are not accessible from EL0, and the system level view of the programmers' model and the memory model. This part includes the description of self-hosted debug.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Part E** Describes the application level view of the AArch32 Execution state, meaning the view from the EL0. It describes the application level view of the programmers' model and the memory model.

**Note**

In AArch32 state, execution at EL0 is execution in User mode.

**Part F** Describes the T32 and A32 instruction sets, that are available in the AArch32 Execution state. These instruction sets are backwards-compatible with earlier versions of the ARM architecture. This part describes the precise effects of each instruction when executed in User mode, described as *unprivileged* execution or execution at EL0, including any restrictions on its use, and how the effects of the instruction differ at higher Exception levels. This information is of primary importance to authors and users of compilers, assemblers, and other programs that generate ARM machine code.

**Note**

User mode is the only mode where software execution is unprivileged.

**Part G** Describes the system level view of the AArch32 Execution state, that is generally compatible with earlier versions of the ARM architecture. This part includes details of the System registers, most of which are not accessible from EL0, and the conceptual coprocessor interface to those registers. It also describes the system level view of the programmers' model and the memory model.

**Part H** Describes the Debug architecture for external debug. This provides configuration, breakpoint and watchpoint support, and a *Debug Communications Channel* (DCC) to a debug host.

**Part I** Describes additional features of the architecture that are not closely coupled to a *processing element* (PE), and therefore are accessed through memory-mapped interfaces. Some of these features are OPTIONAL.

**Part J** Provides pseudocode that describes various features of the ARMv8 architecture.

**Part K, Appendixes**

Provide additional information. Some appendixes give information that is not part of the ARMv8 architectural requirements. The cover page of each appendix indicates its status.

# Using this manual

The information in this manual is organized into parts, as described in this section.

## Part A, Introduction and Architecture Overview

Part A gives an overview of the ARMv8-A architecture profile, including its relationship to the other ARM PE architectures. It introduces the terminology used to describe the architecture, and gives an overview of the Executions states, AArch64 and AArch32. It contains the following chapter:

**Chapter A1** ***Introduction to the ARMv8 Architecture***

Read this for an introduction to the ARMv8 architecture.

## Part B, The AArch64 Application Level Architecture

Part B describes the application level view of the architecture in AArch64 state. It contains the following chapters:

**Chapter B1** ***The AArch64 Application Level Programmers' Model***

Read this for an application level description of the programmers' model for software executing in AArch64 state. It describes execution at EL0 when EL0 is using AArch64 state.

**Chapter B2** ***The AArch64 Application Level Memory Model***

Read this for an application level description of the memory model for software executing in AArch64 state. It describes the memory model for execution in EL0 when EL0 is using AArch64 state. It includes information about ARM memory types, attributes, and memory access controls.

## Part C, The A64 Instruction Set

Part C describes the A64 instruction set, that is used in AArch64 state. It contains the following chapters:

**Chapter C1** ***The A64 Instruction Set***

Read this for a description of the A64 instruction set and common instruction operation details.

**Chapter C2** ***About the A64 Instruction Descriptions***

Read this to understand the format of the A64 instruction descriptions.

**Chapter C3** ***A64 Instruction Set Overview***

Read this for an overview of the individual A64 instructions, that are divided into five functional groups.

**Chapter C4** ***A64 Instruction Set Encoding***

Read this for a description of the A64 instruction set encoding.

**Chapter C5** ***The A64 System Instruction Class***

Read this for a description of the AArch64 system instructions and register descriptions, and the system instruction class encoding space.

**Chapter C6** ***A64 Base Instruction Descriptions***

Read this for information on key aspects of the A64 base instructions and for descriptions of the individual instructions, which are listed in alphabetical order.

**Chapter C7** ***A64 Advanced SIMD and Floating-point Instruction Descriptions***

Read this for information on key aspects of the A64 Advanced SIMD and floating-point instructions and for descriptions of the individual instructions, which are listed in alphabetical order.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### Part D, The AArch64 System Level Architecture

Part D describes the AArch64 the system level view of the architecture. It contains the following chapters:

**Chapter D1** ***The AArch64 System Level Programmers' Model***

Read this for a description of the AArch64 system level view of the programmers' model.

**Chapter D2** ***AArch64 Self-hosted Debug***

Read this for an introduction to, and a description of, self-hosted debug in AArch64 state.

**Chapter D3** ***The AArch64 System Level Memory Model***

Read this for a description of the AArch64 system level view of the general features of the memory system.

**Chapter D4** ***The AArch64 Virtual Memory System Architecture***

Read this for a system level view of the AArch64 Virtual Memory System Architecture (VMSA), the memory system architecture of an ARMv8 implementation that is executing in AArch64 state.

**Chapter D5** ***The Performance Monitors Extension***

Read this for a description of an implementation of the ARM Performance Monitors, that are an optional non-invasive debug component.

**Chapter D6** ***The Generic Timer in AArch64 state***

Read this for a description of an implementation of the AArch64 view of the ARM Generic Timer.

**Chapter D7** ***AArch64 System Register Descriptions***

Read this for an introduction to, and description of, each of the AArch64 System registers.

### Part E, The AArch32 Application Level Architecture

Part E describes the AArch32 application level view of the architecture. It contains the following chapters:

**Chapter E1** ***The AArch32 Application Level Programmers' Model***

Read this for an application level description of the programmers' model for software executing in AArch32 state. It describes execution at EL0 when EL0 is using AArch32 state.

**Chapter E2** ***The AArch32 Application Level Memory Model***

Read this for an application level description of the memory model for software executing in AArch32 state. It describes the memory model for execution in EL0 when EL0 is using AArch32 state. It includes information about ARM memory types, attributes, and memory access controls.

### Part F, The AArch32 Instruction Sets

Part F describes the T32 and A32 instruction sets, that are used in AArch32 state. It contains the following chapters:

**Chapter F1** ***The AArch32 Instruction Sets Overview***

Read this for an overview of the T32 and A32 instruction sets.

**Chapter F2** ***About the T32 and A32 Instruction Descriptions***

Read this to understand the format of the T32 and A32 instruction descriptions.

**Chapter F3** ***T32 Base Instruction Set Encoding***

Read this for an introduction to the T32 instruction set and a description of how the T32 instruction set uses the ARM programmers' model.

**Chapter F4** ***A32 Base Instruction Set Encoding***

Read this for a description of the A32 base instruction set encoding.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Chapter F5** ***T32 and A32 Instruction Sets Advanced SIMD and floating-point Encodings***

Read this for an overview of the T32 and A32 Advanced SIMD and floating-point instruction sets.

**Chapter F6** ***T32 and A32 Base Instruction Set Instruction Descriptions***

Read this for a description of each T32 and A32 base instruction.

**Chapter F7** ***T32 and A32 Advanced SIMD and floating-point Instruction Descriptions***

Read this for a description of each T32 and A32 Advanced SIMD and floating-point instruction.

## Part G, The AArch32 System Level Architecture

Part G describes the AArch32 system level view of the architecture. It contains the following chapters:

**Chapter G1** ***The AArch32 System Level Programmers' Model***

Read this for a description of the AArch32 system level view of the programmers' model for execution in an Exception level that is using AArch32.

**Chapter G2** ***AArch32 Self-hosted Debug***

Read this for an introduction to, and a description of, self-hosted debug in AArch64 state.

**Chapter G3** ***The AArch32 System Level Memory Model***

Read this for a system level view of the general features of the memory system.

**Chapter G4** ***The AArch32 Virtual Memory System Architecture***

Read this for a description of the AArch32 Virtual Memory System Architecture (VMSA).

**Chapter G5** ***The Generic Timer in AArch32 state***

Read this for a description of an implementation of the AArch32 view of the ARM Generic Timer.

**Chapter G6** ***AArch32 System Register Descriptions***

Read this for a description of each of the AArch32 System registers.

## Part H, External Debug

Part H describes the architecture for external debug. It contains the following chapters:

**Chapter H1** ***Introduction to External Debug***

Read this for an introduction to external debug, and a definition of the scope of this part of the manual.

**Chapter H2** ***Debug State***

Read this for a description of debug state, which the PE might enter as the result of a Halting debug event.

**Chapter H3** ***Halting Debug Events***

Read this for a description of the external debug events referred to as Halting debug events.

**Chapter H4** ***The Debug Communication Channel and Instruction Transfer Register***

Read this for a description of the communication between a debugger and the PE debug logic using the Debug Communications Channel and the Instruction Transfer register.

**Chapter H5** ***The Embedded Cross-Trigger Interface***

Read this for a description of the embedded cross-trigger interface.

**Chapter H6** ***Debug Reset and Powerdown Support***

Read this for a description of reset and powerdown support in the Debug architecture.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Chapter H7** ***The Sample-based Profiling Extension***

Read this for a description of the Sample-based Profiling Extension that is an OPTIONAL extension to an ARMv8 implementation.

**Chapter H8** ***About the External Debug Registers***

Read this for some additional information about the external debug registers.

**Chapter H9** ***External Debug Register Descriptions***

Read this for a description of each external debug register.

## Part I, Memory-mapped Components of the ARMv8 Architecture

Part I describes the memory-mapped components in the architecture. It contains the following chapters:

**Chapter I1** ***System Level Implementation of the Generic Timer***

Read this for a definition of a system level implementation of the Generic Timer.

**Chapter I2** ***Recommended Memory-mapped Interfaces to the Performance Monitors***

Read this for a description of the recommended memory-mapped and external debug interfaces to the Performance Monitors.

**Chapter I3** ***Memory-Mapped System Control Register Descriptions***

Read this for a description of each memory-mapped system control register.

## Part J, Architectural Pseudocode

Part J contains pseudocode that describes various features of the ARM architecture. It contains the following chapter:

**Chapter J1** ***ARMv8 Pseudocode***

Read this for the pseudocode definitions that describe various features of the ARMv8 architecture, for operation in AArch64 state and in AArch32 state.

## Part K, Appendixes

This manual contains the following appendixes:

**Appendix K1** ***Architectural Constraints on UNPREDICTABLE behaviors***

Read this for a description of the architecturally-required constraints on UNPREDICTABLE behaviors in the ARMv8 architecture, including AArch32 behaviors that were UNPREDICTABLE in previous versions of the architecture.

**Appendix K2** ***Recommended External Debug Interface***

Read this for a description of the recommended external debug interface.

**Note**

This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.

**Appendix K3** ***Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events***

Read this for a description of ARM recommendations for the use of the IMPLEMENTATION DEFINED event numbers.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Note**

This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.

**Appendix K4 *Recommendations for reporting memory attributes on an interconnect***

Read this for the ARM recommendations about how the architectural memory attributes are reported on an interconnect.

**Appendix K5 *ARMv8 Changes to the T32 and A32 Instruction Sets***

Read this for a summary of the changes that are introduced to the T32 and A32 instruction sets in ARMv8.

**Appendix K6 *Legacy Instruction Syntax for AArch32 Instruction Sets***

Read this for information about the pre-UAL syntax of the AArch32 instruction sets, which can still be valid for the A32 instruction set.

**Appendix K7 *Address translation examples***

Read this for examples of translation table lookups using the translation regimes described in Chapter D4 *The AArch64 Virtual Memory System Architecture* and Chapter G4 *The AArch32 Virtual Memory System Architecture*.

**Appendix K8 *Example OS Save and Restore Sequences***

Read this for software examples that perform the OS Save and Restore sequences for an ARMv8 debug implementation.

**Note**

Chapter H6 *Debug Reset and Powerdown Support* describes the OS Save and Restore mechanism.

**Appendix K9 *Recommended Upload and Download Processes for External Debug***

Read this for information about implementing and using the ARM architecture.

**Note**

This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.

**Appendix K10 *Barrier Litmus Tests***

Read this for examples of the use of barrier instructions provided by the ARMv8 architecture.

**Note**

This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.

**Appendix K11 *ARM Pseudocode Definition***

Read this for definitions of the AArch32 pseudocode.

**Appendix K12 *Pseudocode Index***

Read this for an index of the pseudocode.

**Appendix K13 *Registers Index***

Read this for an alphabetic and functional index of AArch32 and AArch64 registers, and memory-mapped registers.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

# Conventions

The following sections describe conventions that this book can use:

- *Typographic conventions*.
- *Signals*.
- *Numbers*.
- *Pseudocode descriptions*.
- *Assembler syntax descriptions* on page xxiv.

## Typographic conventions

The typographical conventions are:

***italic*** Introduces special terminology, and denotes citations.

**bold** Denotes signal names, and is used for terms in descriptive lists, where appropriate.

`monospace` Used for assembler syntax descriptions, pseudocode, and source code examples.

Also used in the main text for instruction mnemonics and for references to other items appearing in assembler syntax descriptions, pseudocode, and source code examples.

SMALL CAPITALS

Used in body text for a few terms that have specific technical meanings, and are defined in the *Glossary*.

**Colored text** Indicates a link. This can be:

- A URL, for example `http://infocenter.arm.com`.
- A cross-reference, that includes the page number of the referenced information if it is not on the current page, for example, *Assembler syntax descriptions* on page xxiv.
- A link, to a chapter or appendix, or to a glossary entry, or to the section of the document that defines the colored term, for example *Simple sequential execution* or SCTLR.

## Signals

In general this specification does not define hardware signals, but it does include some signal examples and recommendations. The signal conventions are:

**Signal level** The level of an asserted signal depends on whether the signal is active-HIGH or active-LOW. Asserted means:

- HIGH for active-HIGH signals.
- LOW for active-LOW signals.

**Lower-case n** At the start or end of a signal name denotes an active-LOW signal.

## Numbers

Numbers are normally written in decimal. Binary numbers are preceded by `0b`, and hexadecimal numbers by `0x`. In both cases, the prefix and the associated value are written in a `monospace` font, for example `0xFFFF0000`. To improve readability, long numbers can be written with an underscore separator between every four characters, for example `0xFFFF_0000_0000_0000`. Ignore any underscores when interpreting the value of a number.

## Pseudocode descriptions

This manual uses a form of pseudocode to provide precise descriptions of the specified functionality. This pseudocode is written in `monospace` font, and is described in Appendix K11 *ARM Pseudocode Definition*.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Assembler syntax descriptions

This manual contains numerous syntax descriptions for assembler instructions and for components of assembler instructions. These are shown in a `monospace` font, and use the conventions described in *Structure of the A64 assembler language* on page C1-121, Appendix K11 *ARM Pseudocode Definition*, and *Pseudocode operators and keywords* on page K12-5678.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

# Additional reading

This section lists relevant publications from ARM and third parties.

See the Infocenter http://infocenter.arm.com, for access to ARM documentation.

## ARM publications

- *ARM® AMBA® 4 ATB Protocol Specification, ATBv1.0 and ATBv1.1*, (ARM IHI 0032B).
- *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition* (ARM DDI 0406).
- *ARM® Debug Interface Architecture Specification, ADIv5.0 to ADIv5.2* (ARM IHI 0031).
- *ARM® Embedded Trace Macrocell Architecture Specification, ETMv4* (ARM IHI 0064).
- *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0* (ARM IHI 0069).
- *ARM® CoreSight™ SoC Technical Reference Manual* (ARM DDI 0480).
- *ARM® CoreSight™ v2.0 Architecture Specification* (ARM IHI 0029).
- *ARM® Procedure Call Standard for the ARM 64-bit Architecture* (ARM IHI 0055).

## ARMv8 Architecture Introduction and Overview

# Chapter A1
# Introduction to the ARMv8 Architecture

This chapter introduces the ARM architecture and contains the following sections:

- *About the ARM architecture* on page A1-30.
- *Architecture profiles* on page A1-32.
- *ARMv8 architectural concepts* on page A1-33.
- *Supported data types* on page A1-36.
- *Floating-point and Advanced SIMD support* on page A1-46.
- *Cryptographic Extension* on page A1-52.
- *The ARM memory model* on page A1-53.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## A1.1 About the ARM architecture

The ARM architecture described in this Architecture Reference Manual defines the behavior of an abstract machine, referred to as a *processing element*, often abbreviated to *PE*. Implementations compliant with the ARM architecture must conform to the described behavior of the processing element. It is not intended to describe how to build an implementation of the PE, nor to limit the scope of such implementations beyond the defined behaviors.

Except where the architecture specifies differently, the programmer-visible behavior of an implementation that is compliant with the ARM architecture must be the same as a simple sequential execution of the program on the processing element. This programmer-visible behavior does not include the execution time of the program.

The ARM Architecture Reference Manual also describes rules for software to use the processing element.

The ARM architecture includes definitions of:

- An associated debug architecture, see:
  - Chapter D2 *AArch64 Self-hosted Debug*.
  - Chapter G2 *AArch32 Self-hosted Debug*.
  - Part H of this manual, *External Debug* on page 4813.
- Associated trace architectures, that define trace macrocells that implementers can implement with the associated processor hardware. For more information see the *Embedded Trace Macrocell Architecture Specification.*

The ARM architecture is a *Reduced Instruction Set Computer* (RISC) architecture with the following RISC architecture features:

- A large uniform register file.
- A *load/store* architecture, where data-processing operations only operate on register contents, not directly on memory contents.
- Simple addressing modes, with all load/store addresses determined from register contents and instruction fields only.

The architecture defines the interaction of the PE with memory, including caches, and includes a memory translation system. It also describes how multiple PEs interact with each other and with other observers in a system.

This document defines the ARMv8-A architecture *profile*. See *Architecture profiles* on page A1-32 for more information.

The ARM architecture supports implementations across a wide range of performance points. Implementation size, performance, and very low power consumption are key attributes of the ARM architecture.

An important feature of the ARMv8 architecture is backwards compatibility, combined with the freedom for optimal implementation in a wide range of standard and more specialized use cases. The ARMv8 architecture supports:

- A 64-bit Execution state, AArch64.
- A 32-bit Execution state, AArch32, that is compatible with previous versions of the ARM architecture.

**Note**

- The AArch32 Execution state is compatible with the ARMv7-A architecture profile, and enhances that profile to support some features included in the AArch64 Execution state.
- This document describes only the ARMv8-A architecture profile. For the behaviors required by the ARMv7-A and ARMv7-R architecture profiles, see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Both Execution states support SIMD and floating-point instructions:

- AArch32 state provides:
  - SIMD instructions in the base instruction sets, that operate on the 32-bit general-purpose registers.
  - Advanced SIMD instructions that operate on registers in the *SIMD and floating-point register* (SIMD&FP register) file.
  - Floating-point instructions that operate on registers in the SIMD&FP register file.
- AArch64 state provides:
  - Advanced SIMD instructions that operate on registers in the SIMD&FP register file.
  - Floating-point instructions that operate on registers in the SIMD&FP register file.

**Note**

See *Conventions* on page xxiii for information about conventions used in this manual, including the use of SMALL CAPITALS for particular terms that have ARM-specific meanings that are defined in the *Glossary*.

Non-Confidential - Beta

## A1.2 Architecture profiles

The ARM architecture has evolved significantly since its introduction, and ARM continues to develop it. Eight major versions of the architecture have been defined to date, denoted by the version numbers 1 to 8. Of these, the first three versions are now obsolete.

The generic names AArch64 and AArch32 describe the 64-bit and 32-bit Execution states:

**AArch64** Is the 64-bit Execution state, meaning addresses are held in 64-bit registers, and instructions in the base instruction set can use 64-bit registers for their processing. AArch64 state supports the A64 instruction set.

**AArch32** Is the 32-bit Execution state, meaning addresses are held in 32-bit registers, and instructions in the base instruction sets use 32-bit registers for their processing. AArch32 state supports the T32 and A32 instruction sets.

**Note**

The *Base instruction set* comprises the supported instructions other than the Advanced SIMD and floating-point instructions.

See sections *Execution state* on page A1-33 and *The ARM instruction sets* on page A1-34 for more information.

ARM defines three architecture profiles:

**A** Application profile, described in this manual:

- Supports a *Virtual Memory System Architecture* (VMSA) based on a *Memory Management Unit* (MMU).

  **Note**

  An ARMv8-A implementation can be called an AArchv8-A implementation.

- Supports the A64, A32, and T32 instruction sets.

**R** Real-time profile:

- Supports a *Protected Memory System Architecture* (PMSA) based on a *Memory Protection Unit* (MPU).
- Supports the A32 and T32 instruction sets.

**M** Microcontroller profile:

- Implements a programmers' model designed for low-latency interrupt processing, with hardware stacking of registers and support for writing interrupt handlers in high-level languages.
- Implements a variant of the R-profile PMSA.
- Supports a variant of the T32 instruction set.

**Note**

This Architecture Reference Manual describes only the ARMv8-A profile.

For information about the R and M architecture profiles, and earlier ARM architecture versions see:

- The *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.
- The *ARM®v7-M Architecture Reference Manual*.
- The *ARM®v6-M Architecture Reference Manual*.

### A1.2.1 Debug architecture version

The ARM Debug architecture is fully integrated with the architecture, and does not have a separate version number.

## A1.3 ARMv8 architectural concepts

ARMv8 introduces major changes to the ARM architecture, while maintaining a high level of consistency with previous versions of the architecture. The ARMv8 Architecture Reference Manual includes significant changes in the terminology used to describe the architecture, and this section introduces both the ARMv8 architectural concepts and the associated terminology.

The following subsections describe key ARMv8 architectural concepts. Each section introduces the corresponding terms that are used to describe the architecture:

- *Execution state*.
- *The ARM instruction sets* on page A1-34.
- *System registers* on page A1-34.
- *ARMv8 Debug* on page A1-35.

### A1.3.1 Execution state

The Execution state defines the PE execution environment, including:

- The supported register widths.
- The supported instruction sets.
- Significant aspects of:
  - The exception model.
  - The *Virtual Memory System Architecture* (VMSA).
  - The programmers' model.

The Execution states are:

**AArch64** The 64-bit Execution state. This Execution state:

- Provides 31 64-bit general-purpose registers, of which X30 is used as the procedure link register.
- Provides a 64-bit *program counter* (PC), *stack pointer*s (SPs), and *exception link registers* (ELRs).
- Provides 32 128-bit registers for SIMD vector and scalar floating-point support.
- Provides a single instruction set, A64. For more information, see *The ARM instruction sets* on page A1-34.
- Defines the ARMv8 Exception model, with up to four Exception levels, EL0 - EL3, that provide an *execution privilege* hierarchy, see *Exception levels* on page D1-1514.
- Provides support for 64-bit *virtual addressing*. For more information, including the limits on address ranges, see Chapter D4 *The AArch64 Virtual Memory System Architecture*.
- Defines a number of *Process state* (PSTATE) elements that hold PE state. The A64 instruction set includes instructions that operate directly on various PSTATE elements.
- Names each System register using a suffix that indicates the lowest Exception level at which the register can be accessed.

**AArch32** The 32-bit Execution state. This Execution state:

- Provides 13 32-bit general-purpose registers, and a 32-bit PC, SP, and *link register* (LR). The LR is used as both an ELR and a procedure link register.
  Some of these registers have multiple *banked* instances for use in different PE *modes*.
- Provides a single ELR, for exception returns from Hyp mode.
- Provides 32 64-bit registers for Advanced SIMD vector and scalar floating-point support.
- Provides two instruction sets, A32 and T32. For more information, see *The ARM instruction sets* on page A1-34.
- Supports the ARMv7-A exception model, based on *PE modes*, and maps this onto the ARMv8 Exception model, that is based on the Exception levels.
- Provides support for 32-bit virtual addressing.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Defines a number of *Process state* (PSTATE) elements that hold PE state. The A32 and T32 instruction sets include instructions that operate directly on various PSTATE elements, and instructions that access PSTATE by using the *Application Program Status Register* (APSR) or the *Current Program Status Register* (CPSR).

Later subsections give more information about the different properties of the Execution states.

Transitioning between the AArch64 and AArch32 Execution states is known as *interprocessing*. The PE can move between Execution states only on a change of Exception level, and subject to the rules given in *Interprocessing* on page D1-1619. This means different software layers, such as an application, an operating system kernel, and a hypervisor, executing at different Exception levels, can execute in different Execution states.

### A1.3.2 The ARM instruction sets

In ARMv8 the possible instruction sets depend on the Execution state:

**AArch64** AArch64 state supports only a single instruction set, called A64. This is a fixed-length instruction set that uses 32-bit instruction encodings.

For information on the A64 instruction set, see Chapter C3 *A64 Instruction Set Overview*.

**AArch32** AArch32 state supports the following instruction sets:

**A32** This is a fixed-length instruction set that uses 32-bit instruction encodings.

**T32** This is a variable-length instruction set that uses both 16-bit and 32-bit instruction encodings.

In previous documentation, these instruction sets were called the ARM and Thumb instruction sets. ARMv8 extends each of these instruction sets. In AArch32 state, the Instruction set state determines the instruction set that the PE executes.

For information on the A32 and T32 instruction sets, see Chapter F1 *The AArch32 Instruction Sets Overview*.

The ARMv8 instruction sets support SIMD and scalar floating-point instructions. See *Floating-point and Advanced SIMD support* on page A1-46.

### A1.3.3 System registers

System registers provide control and status information of architected features.

The System registers use a standard naming format: <register_name>.<bit_field_name> to identify specific registers as well as control and status bits within a register.

Bits can also be described by their numerical position in the form <register_name>[x:y] or the generic form bits[x:y].

In addition, in AArch64 state, most register names include the lowest Exception level that can access the register as a suffix to the register name:

- <register_name>_ELx, where x is 0, 1, 2, or 3.

For information about Exception levels, see *Exception levels* on page D1-1514.

The System registers comprise:

- The following registers that are described in this manual:
  - General system control registers.
  - Debug registers.
  - Generic Timer registers.
  - Optionally, Performance Monitor registers.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Optionally, one or more of the following groups of registers that are defined in other ARM architecture specifications:
  - Trace System registers, as defined in the *Embedded Trace Macrocell Architecture Specification, ETMv4*.
  - *Generic Interrupt Controller* (GIC) System registers, see *The ARM Generic Interrupt Controller System registers*.

For information about the AArch64 System registers, see Chapter D7 *AArch64 System Register Descriptions*.

For information about the AArch32 System registers, see Chapter G6 *AArch32 System Register Descriptions*.

### The ARM Generic Interrupt Controller System registers

From version 3 of the ARM Generic Interrupt Controller architecture, GICv3, the GIC architecture specification defines a System register interface to some of its functionality. The System register summaries in this manual include these registers, see:

- *About the GIC System registers* on page C5-287, for more information about the AArch64 GIC System registers.
- *Generic Interrupt Controller System registers, functional groups* on page G4-4175, for more information about the AArch32 GIC System registers.

These sections give only short overviews of the GIC System registers. For more information, including descriptions of the registers, see the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0* (ARM IHI 0069).

**Note**

The programmers' model for earlier versions of the GIC architecture is wholly memory-mapped.

## A1.3.4 ARMv8 Debug

ARMv8 supports the following:

**Self-hosted debug**

In this model, the PE generates *debug exceptions*. Debug exceptions are part of the ARMv8 Exception model.

**External debug**

In this model, *debug events* cause the PE to enter *Debug state*. In Debug state the PE is controlled by an external debugger.

All ARMv8 implementations support both models. The model chosen by a particular user depends on the debug requirements during different stages of the design and development life cycle of the product. For example, external debug might be used during debugging of the hardware implementation and OS bring-up, and self-hosted debug might be used during application development.

For more information about self-hosted debug:

- In AArch64 state, see Chapter D2 *AArch64 Self-hosted Debug*.
- In AArch32 state, see Chapter G2 *AArch32 Self-hosted Debug*.

For more information about external debug, see *Part H External Debug*.

## A1.4 Supported data types

The ARMv8 architecture supports the following integer data types:

**Byte** 8 bits.
**Halfword** 16 bits.
**Word** 32 bits.
**Doubleword** 64 bits.
**Quadword** 128 bits.

The architecture also supports the following floating-point data types:

- Half-precision, see *Half-precision floating-point formats* on page A1-40 for details.
- Single-precision, see *Single-precision floating-point format* on page A1-42 for details.
- Double-precision, see *Double-precision floating-point format* on page A1-43 for details.

It also supports:

- Fixed-point interpretation of words and doublewords. See *Fixed-point format* on page A1-44.
- Vectors, where a register holds multiple elements, each of the same data type. See *Vector formats* on page A1-37 for details.

The ARMv8 architecture provides two register files:

- A general-purpose register file.
- A SIMD&FP register file.

In each of these, the possible register widths depend on the Execution state.

In AArch64 state:

- A general-purpose register file contains 64-bit registers:
  - Many instructions can access these registers as 64-bit registers or as 32-bit registers, using only the bottom 32 bits.
- A SIMD&FP register file contains 128-bit registers:
  - The quadword integer data types only apply to the SIMD&FP register file.
  - The floating-point data types only apply to the SIMD&FP register file.
  - While the AArch64 vector registers support 128-bit vectors, the effective vector length can be 64-bits or 128-bits depending on the A64 instruction encoding used, see *Instruction Mnemonics* on page C1-121.

For more information on the register files in AArch64, see *Registers in AArch64 Execution state* on page B1-59.

In AArch32 state:

- A general-purpose register file contains 32-bit registers:
  - Two 32-bit registers can support a doubleword.
  - Vector formatting is supported, see Figure A1-4 on page A1-40.
- A SIMD&FP register file contains 64-bit registers:
  - AArch32 state does not support quadword integer or floating-point data types.

**Note**

Two consecutive 64-bit registers can be used as a 128-bit register.

For more information on the register files in AArch32, see *The general-purpose registers, and the PC, in AArch32 state* on page E1-2316.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### A1.4.1 Vector formats

In an implementation that includes the SIMD instructions that operate on the SIMD&FP register file, a register can hold one or more packed elements, all of the same size and type. The combination of a register and a data type describes a vector of elements. The vector is considered to be an array of elements of the data type specified in the instruction. The number of elements in the vector is implied by the size of the data elements and the size of the register.

Vector indices are in the range 0 to (number of elements – 1). An index of 0 refers to the least significant end of the vector.

#### Vector formats in AArch64 state

In AArch64 state, the SIMD&FP registers can be referred to as V*n*, where *n* is a value from 0 to 31.

The SIMD&FP registers support three data formats for loads, stores and data processing operations:

- A single, scalar, element in the least significant bits of the register.
- A 64-bit vector of byte, halfword, or word elements.
- A 128-bit vector of byte, halfword, word or doubleword elements.

The element sizes are defined in Table A1-1 with the vector format described as:

- For a 128-bit vector: Vn{.2D, .4S, .8H, .16B}.
- For a 64-bit vector: Vn{.1D, .2S, .4H, .8B}.

**Table A1-1 SIMD elements**

| Mnemonic | Size |
|---|---|
| B | 8 bits |
| H | 16 bits |
| S | 32 bits |
| D | 64 bits |

Figure A1-1 on page A1-38 shows the SIMD vectors in AArch64 state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

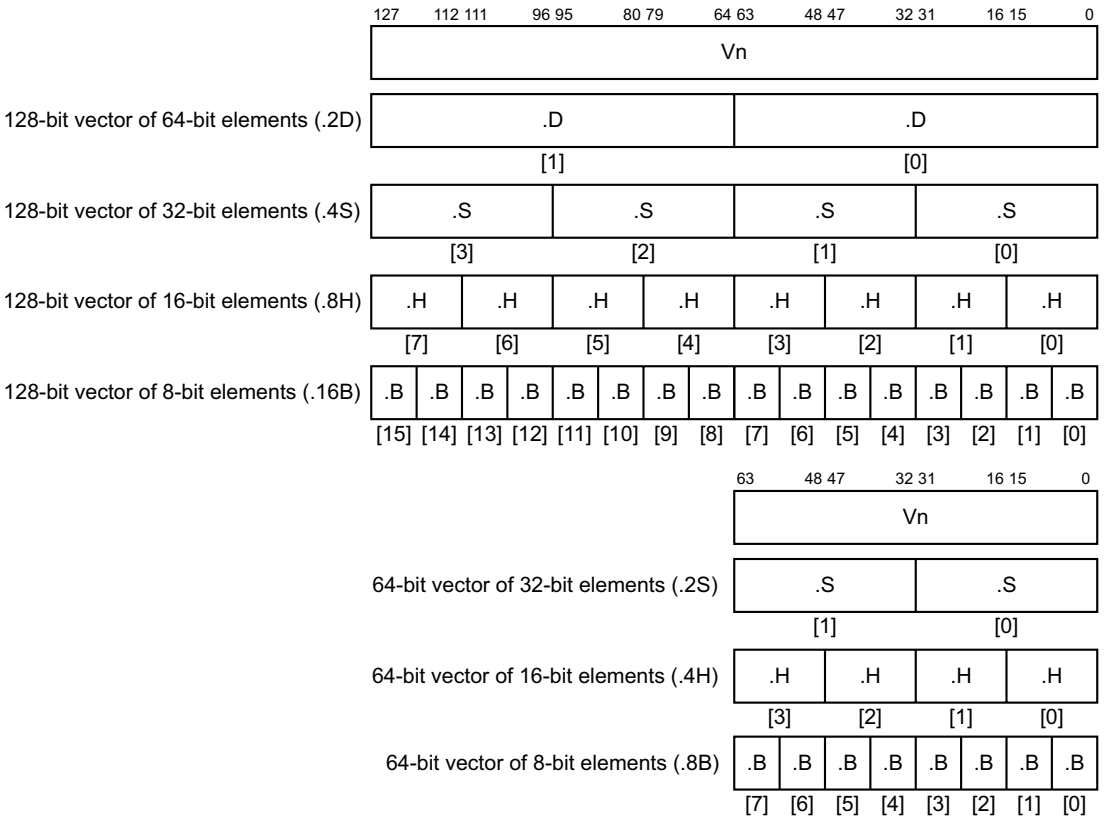

**Figure A1-1 SIMD vectors in AArch64 state**

### Vector formats in AArch32 state

Table A1-2 shows the available formats. Each instruction description specifies the data types that the instruction supports.

**Table A1-2 Advanced SIMD data types in AArch32**

| Data type specifier | Meaning |
|---|---|
| `.<size>` | Any element of <size> bits |
| `.F<size>` | Floating-point number of <size> bits |
| `.I<size>` | Signed or unsigned integer of <size> bits |
| `.P<size>` | Polynomial over {0, 1} of degree less than <size> |
| `.S<size>` | Signed integer of <size> bits |
| `.U<size>` | Unsigned integer of <size> bits |

*Polynomial arithmetic over {0, 1}* on page A1-45 describes the polynomial data type.

The `.F16` data type is the half-precision data type selected by the FPSCR.AHP bit.

The `.F32` data type is the ARM standard single-precision floating-point data type, see *Single-precision floating-point format* on page A1-42.

The instruction definitions use a data type specifier to define the data types appropriate to the operation. Figure A1-2 on page A1-39 shows the hierarchy of the Advanced SIMD data types.

**Figure A1-2 Advanced SIMD data type hierarchy in AArch32**

For example, a multiply instruction must distinguish between integer and floating-point data types.

An integer multiply instruction that generates a double-width (long) result must specify the input data types as signed or unsigned. However, some integer multiply instructions use modulo arithmetic, and therefore do not have to distinguish between signed and unsigned inputs.

Figure A1-3 on page A1-40 shows the Advanced SIMD vectors in AArch32 state.

**Note**

In AArch32 state, a pair of even and following odd numbered doubleword registers can be concatenated and treated as a single quadword register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

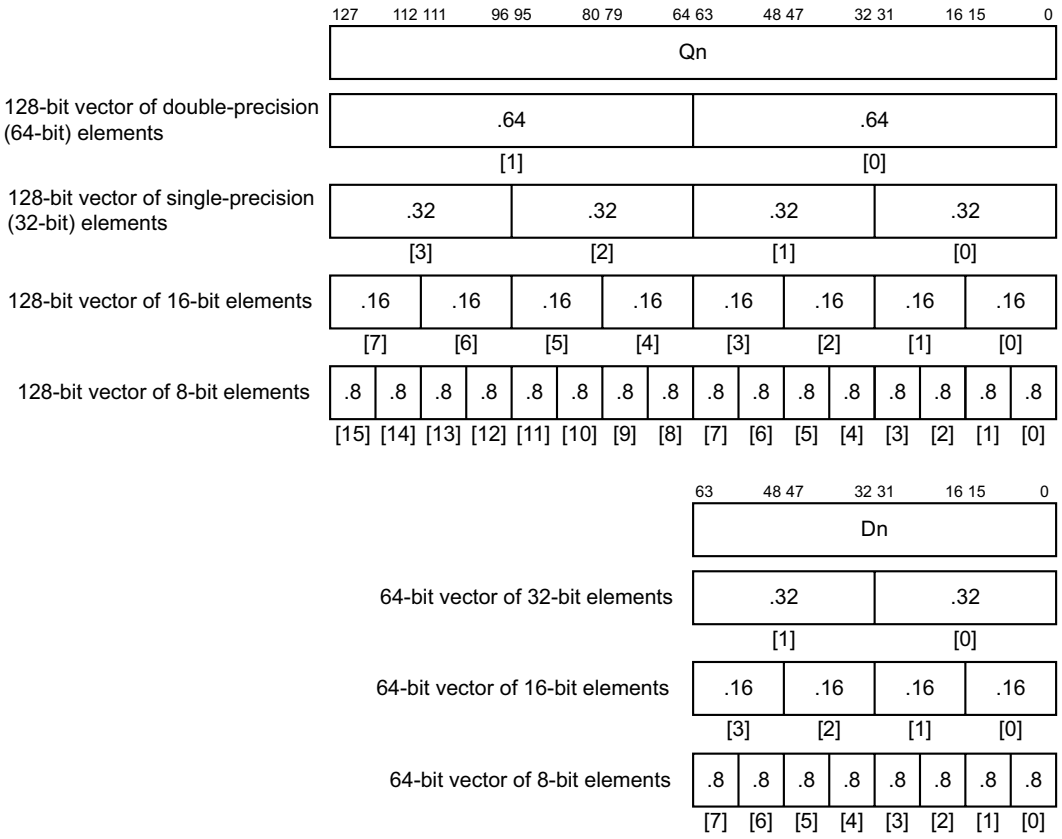

**Figure A1-3 Advanced SIMD vectors in AArch32**

The AArch32 general-purpose registers support vectors formats for use by the SIMD instructions in the Base instruction set. Figure A1-4 shows these formats, that means that a general-purpose register can be treated as either two halfwords or four bytes.

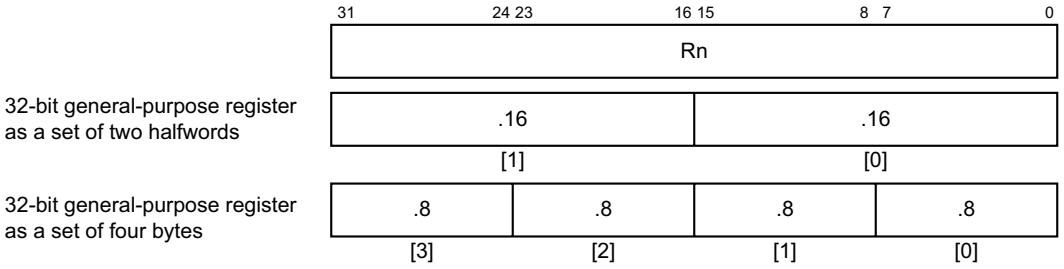

**Figure A1-4 Vector formatting in AArch32**

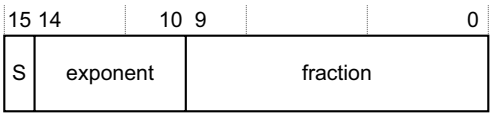
### A1.4.2 Half-precision floating-point formats

ARMv8 supports two half-precision floating-point formats:

- IEEE half-precision, as described in the IEEE 754-2008 standard.
- Alternative half-precision.



**Note**

Half-precision floating-point formats can only be converted to and from other floating-point formats. They cannot be used in any other data processing operations. This applies to both AArch32 state and AArch64 state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The description of IEEE half-precision includes ARM-specific details that are left open by the standard, and is only an introduction to the formats and to the values they can contain. For more information, especially on the handling of infinities, NaNs and signed zeros, see the IEEE 754 standard.

For both half-precision floating-point formats, the layout of the 16-bit format is the same. The format is:

The interpretation of the format depends on the value of the exponent field, bits[14:10] and on which half-precision format is being used.

**0 < exponent <** `0x1F`

The value is a normalized number and is equal to:

$(-1)^S \times 2^{(\text{exponent}-15)} \times (1.\text{fraction})$

The minimum positive normalized number is $2^{-14}$, or approximately $6.104 \times 10^{-5}$.

The maximum positive normalized number is $(2 - 2^{-10}) \times 2^{15}$, or 65504.

Larger normalized numbers can be expressed using the alternative format when the exponent == `0x1F`.

**exponent == 0**

The value is either a zero or a denormalized number, depending on the fraction bits:

**fraction == 0**

The value is a zero. There are two distinct zeros:

**+0** when S==0

**–0** when S==1.

**fraction != 0**

The value is a denormalized number and is equal to:

$(-1)^S \times 2^{-14} \times (0.\text{fraction})$

The minimum positive denormalized number is $2^{-24}$, or approximately $5.960 \times 10^{-8}$.

**exponent ==** `0x1F`

The value depends on which half-precision format is being used:

**IEEE half-precision**

The value is either an infinity or a Not a Number (NaN), depending on the fraction bits:

**fraction == 0**

The value is an infinity. There are two distinct infinities:

**+infinity** When S==0. This represents all positive numbers that are too big to be represented accurately as a normalized number.

**-infinity** When S==1. This represents all negative numbers with an absolute value that is too big to be represented accurately as a normalized number.

**fraction != 0**

The value is a NaN, and is either a *quiet NaN* or a *signaling NaN*.

The two types of NaN are distinguished by their most significant fraction bit, bit[9]:

**bit[9] == 0** The NaN is a signaling NaN. The sign bit can take any value, and the remaining fraction bits can take any value except all zeros.

**bit[9] == 1** The NaN is a quiet NaN. The sign bit and remaining fraction bits can take any value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Alternative half-precision**

The value is a normalized number and is equal to:

$-1^S \times 2^{16} \times (1.\text{fraction})$

The maximum positive normalized number is $(2-2^{-10}) \times 2^{16}$ or 131008.

## A1.4.3 Single-precision floating-point format

The single-precision floating-point format is as defined by the IEEE 754 standard.

This description includes ARM-specific details that are left open by the standard. It is only intended as an introduction to the formats and to the values they can contain. For full details, especially of the handling of infinities, NaNs and signed zeros, see the IEEE 754 standard.

A single-precision value is a 32-bit word with the format:

The interpretation of the format depends on the value of the exponent field, bits[30:23]:

**0 < exponent < `0xFF`**

The value is a *normalized number* and is equal to:

$(-1)^S \times 2^{(\text{exponent} - 127)} \times (1.\text{fraction})$

The minimum positive normalized number is $2^{-126}$, or approximately $1.175 \times 10^{-38}$.

The maximum positive normalized number is $(2 - 2^{-23}) \times 2^{127}$, or approximately $3.403 \times 10^{38}$.

**exponent == 0**

The value is either a zero or a *denormalized number*, depending on the fraction bits:

**fraction == 0**

The value is a zero. There are two distinct zeros:

**+0** When S==0.

**–0** When S==1.

These usually behave identically. In particular, the result is *equal* if +0 and –0 are compared as floating-point numbers. However, they yield different results in some circumstances. For example, the sign of the infinity produced as the result of dividing by zero depends on the sign of the zero. The two zeros can be distinguished from each other by performing an integer comparison of the two words.

**fraction != 0**

The value is a denormalized number and is equal to:

$(-1)^S \times 2^{-126} \times (0.\text{fraction})$

The minimum positive denormalized number is $2^{-149}$, or approximately $1.401 \times 10^{-45}$.

Denormalized numbers are always flushed to zero in AArch32 Advanced SIMD processing. They are optionally flushed to zero in floating-point processing and AArch64 SIMD. For details see *Flush-to-zero* on page A1-49.

**exponent == `0xFF`**

The value is either an *infinity* or a *Not a Number* (NaN), depending on the fraction bits:

**fraction == 0**

The value is an infinity. There are two distinct infinities:

**+infinity** When S==0. This represents all positive numbers that are too big to be represented accurately as a normalized number.

**-infinity** When S==1. This represents all negative numbers with an absolute value that is too big to be represented accurately as a normalized number.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**fraction != 0**

The value is a NaN, and is either a *quiet NaN* or a *signaling NaN*.

The two types of NaN are distinguished by their most significant fraction bit, bit[22]:

**bit[22] == 0**

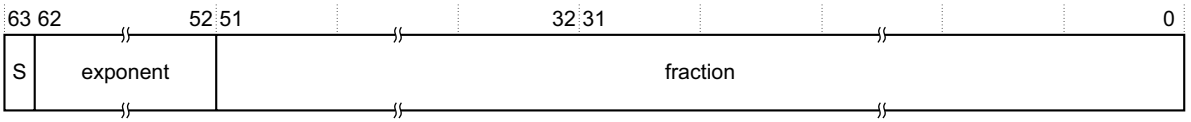
The NaN is a signaling NaN. The sign bit can take any value, and the remaining fraction bits can take any value except all zeros.

**bit[22] == 1**

The NaN is a quiet NaN. The sign bit and remaining fraction bits can take any value.

For details of the *default NaN* see *NaN handling and the Default NaN* on page A1-50.

**Note**



NaNs with different sign or fraction bits are distinct NaNs, but this does not mean software can use floating-point comparison instructions to distinguish them. This is because the IEEE 754 standard specifies that a NaN compares as *unordered* with everything, including itself.

### A1.4.4 Double-precision floating-point format

The double-precision floating-point format is as defined by the IEEE 754 standard. Double-precision floating-point is supported by both floating-point and SIMD instructions in AArch64 state, and only by floating-point instructions in AArch32 state.

This description includes implementation-specific details that are left open by the standard. It is only intended as an introduction to the formats and to the values they can contain. For full details, especially of the handling of infinities, NaNs and signed zeros, see the IEEE 754 standard.

A double-precision value is a 64-bit doubleword, with the format:

Double-precision values represent numbers, infinities and NaNs in a similar way to single-precision values, with the interpretation of the format depending on the value of the exponent:

**0 < exponent <** `0x7FF`

The value is a normalized number and is equal to:

$(-1)^S \times 2^{(exponent-1023)} \times (1.fraction)$

The minimum positive normalized number is $2^{-1022}$, or approximately $2.225 \times 10^{-308}$.

The maximum positive normalized number is $(2 - 2^{-52}) \times 2^{1023}$, or approximately $1.798 \times 10^{308}$.

**exponent == 0**

The value is either a zero or a denormalized number, depending on the fraction bits:

**fraction == 0**

The value is a zero. There are two distinct zeros that behave in the same way as the two single-precision zeros:

**+0** when S==0

**–0** when S==1.

**fraction != 0**

The value is a denormalized number and is equal to:

$(-1)^S \times 2^{-1022} \times (0.fraction)$

The minimum positive denormalized number is $2^{-1074}$, or approximately $4.941 \times 10^{-324}$.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Optionally, denormalized numbers are flushed to zero in floating-point calculations. For details see *Flush-to-zero* on page A1-49.

**exponent ==** `0x7FF`

The value is either an infinity or a NaN, depending on the fraction bits:

**fraction == 0**

The value is an infinity. As for single-precision, there are two infinities:

**+infinity** When S==0.

**-infinity** When S==1.

**fraction != 0**

The value is a NaN, and is either a *quiet NaN* or a *signaling NaN*.

The two types of NaN are distinguished by their most significant fraction bit, bit[51] of the doubleword:

**bit[51] == 0**

The NaN is a signaling NaN. The sign bit can take any value, and the remaining fraction bits can take any value except all zeros.

**bit[51] == 1**

The NaN is a quiet NaN. The sign bit and the remaining fraction bits can take any value.

For details of the *default NaN* see *NaN handling and the Default NaN* on page A1-50.

**Note**

NaNs with different sign or fraction bits are distinct NaNs, but this does not mean software can use floating-point comparison instructions to distinguish them. This is because the IEEE 754 standard specifies that a NaN compares as *unordered* with everything, including itself.

### A1.4.5 Fixed-point format

Fixed-point formats are used only for conversions between floating-point and fixed-point values. They apply to general-purpose registers.

Fixed-point values can be signed or unsigned, and can be 16-bit or 32-bit. Conversion instructions take an argument that specifies the number of fraction bits in the fixed-point number. That is, it specifies the position of the binary point.

### A1.4.6 Conversion between floating-point and fixed-point values

ARMv8 supports the conversion of a scalar floating-point to or from a signed or unsigned fixed-point value in a general-purpose register.

The instruction argument #fbits indicates that the general-purpose register holds a fixed-point number with fbits bits after the binary point, where fbits is in the range 1 to 64 for a 64-bit general-purpose register, or 1 to 32 for a 32-bit general-purpose register.

More specifically:

- For a 64-bit register $X_d$:
  - The integer part is $X_d[63:\#fbits]$.
  - The fractional part is $X_d[(\#fbits-1):0]$.
- For a 32-bit register $W_d$ or $R_d$:
  - The integer part is $W_d[31:\#fbits]$ or $R_d[31:\#fbits]$.
  - The fractional part is $W_d[(\#fbits-1):0]$ or $R_d[(\#fbits-1):0]$.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

These instructions might generate the following exceptions:

**Invalid Operation** When the floating-point input is NaN or Infinity or when a numerical value cannot be represented within the destination register.

**Inexact** When the numeric result differs from the input.

**Input Denormal** When flush-to-zero mode is enabled and the denormal input is replaced by a zero.

**Note**

An out of range fixed-point result is saturated to the destination size.

### A1.4.7 Polynomial arithmetic over {0, 1}

Some SIMD instructions that operate on SIMD&FP registers can operate on polynomials over {0, 1}, see *Supported data types* on page A1-36. The polynomial data type represents a polynomial in x of the form $b_{n-1}x^{n-1} + \ldots + b_1x + b_0$ where $b_k$ is bit[k] of the value.

The coefficients 0 and 1 are manipulated using the rules of Boolean arithmetic:

- $0 + 0 = 1 + 1 = 0$
- $0 + 1 = 1 + 0 = 1$
- $0 \times 0 = 0 \times 1 = 1 \times 0 = 0$
- $1 \times 1 = 1$.

That is:

- Adding two polynomials over {0, 1} is the same as a bitwise exclusive OR.
- Multiplying two polynomials over {0, 1} is the same as integer multiplication except that partial products are exclusive-ORed instead of being added.

A64, A32 and T32 provide instructions for performing polynomial multiplication of 8-bit values.

- For AArch32, see *VMUL (integer and polynomial)* on page F7-3502 and *VMULL (integer and polynomial)* on page F7-3508.
- For AArch64, see *PMUL* on page C7-1177 and *PMULL, PMULL2* on page C7-1179.

The Cryptographic Extension adds the ability to perform long polynomial multiplies of 64-bit values. See *PMULL, PMULL2* on page C7-1179.

#### Pseudocode description of polynomial multiplication

In pseudocode, polynomial addition is described by the EOR operation on bitstrings.

Polynomial multiplication is described by the `PolynomialMult()` function defined in Chapter J1 *ARMv8 Pseudocode*.

## A1.5 Floating-point and Advanced SIMD support

**Note**

In AArch32 state, the SIMD instructions that operate on SIMD&FP registers are always described as the Advanced SIMD instructions, to distinguish them from the SIMD instructions in the base instruction sets, that operate on the 32-bit general-purpose registers. The A64 instruction set does not provide any SIMD instructions that operate on the general-purpose registers, and therefore some AArch64 state descriptions use SIMD as a synonym for Advanced SIMD. Unless the context clearly indicates otherwise, this section describes the support for SIMD instructions that operate on SIMD&FP registers.

ARMv8 can support the following levels of support for floating-point and Advanced SIMD instructions:

- Full floating-point and SIMD support without exception trapping.
- Full floating-point and SIMD support with exception trapping.
- No floating-point or SIMD support. This option is licensed only for implementations targeting specialised markets.

  **Note**

  All systems that support standard operating systems with rich application environments provide hardware support for floating-point and Advanced SIMD. It is a requirement of the ARM Procedure Call Standard for AArch64, see *Procedure Call Standard for the ARM 64-bit Architecture*.

ARMv8 supports single-precision (32-bit) and double-precision (64-bit) floating-point data types and arithmetic as defined by the IEEE 754 floating-point standard. It also supports the half-precision (16-bit) floating-point data type for data storage only, by supporting conversions between single-precision and half-precision data types and double-precision and half-precision data types.

The SIMD instructions provide packed *Single Instruction Multiple Data (SIMD)* and single-element scalar operations, and support:

- Single-precision and double-precision arithmetic in AArch64 state.
- Single-precision arithmetic only in AArch32 state.

Floating-point support in AArch64 state SIMD is IEEE 754-2008 compliant with:

- Configurable rounding modes.
- Configurable Default NaN behavior.
- Configurable Flush-to-zero behavior.

Floating-point computation using AArch32 Advanced SIMD instructions remains unchanged from ARMv7. A32 and T32 Advanced SIMD floating-point always uses ARM standard floating-point arithmetic and performs IEEE 754 floating-point arithmetic with the following restrictions:

- Denormalized numbers are flushed to zero, see *Flush-to-zero* on page A1-49.
- Only default NaNs are supported, see *NaN handling and the Default NaN* on page A1-50.
- The Round to Nearest rounding mode is used.
- Untrapped floating-point exception handling is used for all floating-point exceptions.

ARMv8 introduces new instructions for AArch32 state:

- Floating-point selection, see *VSELEQ, VSELGE, VSELGT, VSELVS* on page F7-3661.
- Floating-point maximum and minimum numbers, see *VMAXNM* on page F7-3440 and *VMINNM* on page F7-3447.
- Floating-point integer conversions with directed rounding modes, see:
  - *VCVTA (Advanced SIMD)* on page F7-3343 and *VCVTA (floating-point)* on page F7-3345.
  - *VCVTM (Advanced SIMD)* on page F7-3350 and *VCVTM (floating-point)* on page F7-3352.
  - *VCVTN (Advanced SIMD)* on page F7-3354 and *VCVTN (floating-point)* on page F7-3356.
  - *VCVTP (Advanced SIMD)* on page F7-3358 and *VCVTP (floating-point)* on page F7-3360.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Floating-point round to integral floating-point, see:
  - *VRINTA (Advanced SIMD)* on page F7-3617 and *VRINTA (floating-point)* on page F7-3619.
  - *VRINTM (Advanced SIMD)* on page F7-3621 and *VRINTM (floating-point)* on page F7-3623.
  - *VRINTN (Advanced SIMD)* on page F7-3625 and *VRINTN (floating-point)* on page F7-3627.
  - *VRINTP (Advanced SIMD)* on page F7-3629 and *VRINTP (floating-point)* on page F7-3631.
  - *VRINTR* on page F7-3633.
  - *VRINTX (Advanced SIMD)* on page F7-3635 and *VRINTX (floating-point)* on page F7-3637.
  - *VRINTZ (Advanced SIMD)* on page F7-3639 and *VRINTZ (floating-point)* on page F7-3641.
- Floating-point conversions between half-precision and double-precision, see *VCVTB* on page F7-3347 and *VCVTT* on page F7-3365.

If floating-point exception trapping is supported, floating-point exceptions, such as overflow or division by zero, can be handled without trapping. This applies to both floating-point and SIMD operations. When handled in this way, a floating-point exception causes a cumulative status register bit to be set to 1 and a default result to be produced by the operation. For more information about floating-point exceptions, see *Floating-point exception traps* on page D1-1568.

In AArch64 state, the following registers control floating-point operation and return floating-point status information:

- The Floating-Point Control Register, FPCR, controls:
  - The half-precision format where applicable, FPCR.AHP bit.
  - Default NaN behavior, FPCR.DN bit.
  - Flush to zero behavior, FPCR.FZ bit.
  - Rounding mode support, FPCR.Rmode field.
  - Len and Stride fields associated with AArch32 execution, and only supported for a context save and restore in AArch64. These fields are obsolete in ARMv8 and can be implemented as RAZ/WI. If they are implemented as RW and are programmed to a nonzero value, they make some AArch32 floating-point instructions UNDEFINED.
  - Floating-point exception trap controls, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits, see *Floating-point exception traps* on page D1-1568. In an implementation that does not support trapping of floating-point exceptions these bits are RES0.
- The Floating-Point Status Register, FPSR, provides:
  - Cumulative floating-point exceptions flags, FPSR.{IDC, IXC, UFC, OFC, DZC, IOC and QC}.
  - TheAArch32 floating-point comparison flags {N,Z,C,V}. These bits are RES0 if AArch32 floating-point is not implemented.

    **Note**

    In AArch64, the process state flags, PSTATE.{N,Z,C,V} are used for all data processing compares and any associated conditional execution.

AArch32 state provides a single Floating-Point Status and Control Register, FPSCR, combining the FPCR and FPSR fields.

For system level information about the SIMD and floating-point support, see *Advanced SIMD and floating-point support* on page G1-3841.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### A1.5.1 Instruction support

The floating-point and SIMD support includes the following types of instructions:

- Load and store for single elements and vectors of multiple elements.

  **Note**

  Single elements are also referred to as scalar elements.

- Data processing on single and multiple elements for both integer and floating-point data types.
- Floating-point conversion:
  - Half-precision, single-precision, and double-precision conversions.
  - Single-precision, double-precision, and fixed point integer conversions.
  - Single-precision, double-precision, and integer conversions.
- Floating-point rounding.

For more information on the floating-point and SIMD instructions in AArch64 state, see Chapter C3 *A64 Instruction Set Overview*.

For more information on the floating-point and Advanced SIMD instructions in AArch32 state, see Chapter F5 *T32 and A32 Instruction Sets Advanced SIMD and floating-point Encodings*.

### A1.5.2 Floating-point standards, and terminology

The ARM includes support for all the required features of ANSI/IEEE Std 754-2008, *IEEE Standard for Binary Floating-Point Arithmetic*, referred to as IEEE 754-2008. However, some terms in this manual are based on the 1985 version of this standard, referred to as IEEE 754-1985:

- ARM floating-point terminology generally uses the IEEE 754-1985 terms. This section summarizes how IEEE 754-2008 changes these terms.
- References to IEEE 754 that do not include the issue year apply to either issue of the standard.

Table A1-3 shows how the terminology in this manual differs from that used in IEEE 754-2008.

**Table A1-3 Floating-point terminology**

| This manual | IEEE 754-2008 |
|---|---|
| Normalized [a] | Normal |
| Denormal, or denormalized | Subnormal |
| Round towards Minus Infinity (RM) | roundTowardsNegative |
| Round towards Plus Infinity (RP) | roundTowardsPositive |
| Round towards Zero (RZ) | roundTowardZero |
| Round to Nearest (RN) | roundTiesToEven |
| Round to Nearest with Ties to Away | roundTiesToAway |
| Rounding mode | Rounding-direction attribute |

a. *Normalized number* is used in preference to *normal number*, because of the other specific uses of *normal* in this manual.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### A1.5.3 ARM standard floating-point input and output values

ARMv8 provides full IEEE 754 floating-point arithmetic support. In AArch32, floating-point operations performed using Advanced SIMD instructions are limited to *ARM standard floating-point operation*, regardless of the selected rounding mode in the FPSCR. Unlike AArch32, AArch64 SIMD floating point arithmetic is performed using the rounding mode selected by the FPCR.

ARM standard floating-point arithmetic supports the following input formats defined by the IEEE 754 floating-point standard:

- Zeros.
- Normalized numbers.
- Denormalized numbers are flushed to 0 before floating-point operations, see *Flush-to-zero*.
- NaNs.
- Infinities.

ARM standard floating-point arithmetic supports the Round to Nearest (roundTiesToEven) rounding mode defined by the IEEE 754 standard.

ARM standard floating-point arithmetic supports the following output result formats defined by the IEEE 754 standard:

- Zeros.
- Normalized numbers.
- Results that are less than the minimum normalized number are flushed to zero, see *Flush-to-zero*.
- NaNs produced in floating-point operations are always the default NaN, see *NaN handling and the Default NaN* on page A1-50.
- Infinities.

### A1.5.4 Flush-to-zero

The performance of floating-point processing can be reduced when doing calculations involving denormalized numbers and Underflow exceptions. In many algorithms, this performance can be recovered, without significantly affecting the accuracy of the final result, by replacing the denormalized operands and intermediate results with zeros. To permit this optimization, ARM floating-point implementations have a processing mode called *Flush-to-zero* mode. AArch32 Advanced SIMD floating-point instructions always use Flush-to-zero mode.

Behavior in Flush-to-zero mode differs from standard IEEE 754 arithmetic in the following ways:

- All inputs to floating-point operations that are double-precision denormalized numbers or single-precision denormalized numbers are treated as though they were zero. This causes an Input Denormal exception, but does not cause an Inexact exception. The Input Denormal exception occurs only in Flush-to-zero mode.

  In AArch32, the FPSCR contains a cumulative exception bit FPSCR.IDC and optional trap enable bit FPSCR.IDE corresponding to Input Denormal exception.

  In AArch64 the FPSR contains a cumulative exception bit FPSR.IDC and optional trap enable bit FPCR.IDE corresponding to the Input Denormal exception.

  The occurrence of all exceptions except Input Denormal is determined using the input values after flush-to-zero processing has occurred.

- The result of a floating-point operation is flushed to zero if the result of the operation before rounding satisfies the condition:

  $0 < \texttt{Abs(result)} <$ MinNorm, where:

  — MinNorm is $2^{-126}$ for single-precision

  — MinNorm is $2^{-1022}$ for double-precision.

  This causes the FPSR.UFC bit to be set to 1, and prevents any Inexact exception from occurring for the operation.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Underflow exceptions occur only when a result is flushed to zero.

In all implementations Underflow exceptions that occur in Flush-to-zero mode are always treated as untrapped, even when the Underflow trap enable bit, FPCR.UFE, is set to 1.

- An Inexact exception does not occur if the result is flushed to zero, even though the final result of zero is not equivalent to the value that would be produced if the operation were performed with unbounded precision and exponent range.

When an input or a result is flushed to zero the value of the sign bit of the zero is preserved. That is, the sign bit of the zero matches the sign bit of the input or result that is being flushed to zero.

Flush-to-zero mode has no effect on half-precision numbers that are inputs to floating-point operations, or results from floating-point operations.

**Note**

Flush-to-zero mode is incompatible with the IEEE 754 standard, and must not be used when IEEE 754 compatibility is a requirement. Flush-to-zero mode must be used with care. Although it can improve performance on some algorithms, there are significant limitations on its use. These are application dependent:

- On many algorithms, it has no noticeable effect, because the algorithm does not normally use denormalized numbers.
- On other algorithms, it can cause exceptions to occur or seriously reduce the accuracy of the results of the algorithm.

### A1.5.5 NaN handling and the Default NaN

The IEEE 754 standard specifies that:

- An operation that produces an Invalid Operation floating-point exception generates a quiet NaN as its result if that exception is untrapped.
- An operation involving a quiet NaN operand, but not a signaling NaN operand, returns an input NaN as its result.

The floating-point processing behavior when Default NaN mode is disabled adheres to this, with the following additions:

- If an untrapped Invalid Operation floating-point exception is produced, the quiet NaN result is derived from:
  - The first signaling NaN operand, if the exception was produced because at least one of the operands is a signaling NaN.
  - Otherwise, the default NaN.
- If an untrapped Invalid Operation floating-point exception is not produced, but at least one of the operands is a quiet NaN, the result is derived from the first quiet NaN operand.

Depending on the operation, the exact value of a derived quiet NaN result may differ in both sign and number of fraction bits from its source. For a quiet NaN result derived from signaling NaN operand, the most-significant fraction bit is set to 1.

**Note**

- In these descriptions, *first operand* relates to the left-to-right ordering of the arguments to the pseudocode function that describes the operation.
- The IEEE 754 standard specifies that the sign bit of a NaN has no significance.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The floating-point and SIMD processing behavior when Default NaN mode is enabled is that the Default NaN is the result of all floating-point operations that either:

- Generate untrapped Invalid Operation floating-point exceptions.
- Have one or more quiet NaN inputs, but no signaling NaN inputs.

Table A1-4 shows the format of the default NaN for ARM floating-point operations.

Default NaN mode is selected for the floating-point processing by setting the FPCR.DN bit to 1.

Other aspects of the functionality of the Invalid Operation exception are not affected by Default NaN mode. These are that:

- If untrapped, it causes the FPSR.IOC bit be set to 1.
- If trapped, it causes a user trap handler to be invoked.

**Table A1-4 Default NaN encoding**

| | Half-precision, IEEE Format | Single-precision | Double-precision |
|---|---|---|---|
| Sign bit | 0 | 0 | 0 |
| Exponent | `0x1F` | `0xFF` | `0x7FF` |
| Fraction | Bit[9] == 1, bits[8:0] == 0 | bit[22] == 1, bits[21:0] == 0 | bit[51] == 1, bits[50:0] == 0 |

## A1.6 Cryptographic Extension

The presence of this Extension in an implementation is subject to export license controls. The Cryptographic Extension is an extension of the SIMD support and operates on the vector register file. It provides instructions for the acceleration of encryption and decryption to support the following:

- AES
- SHA1
- SHA2-256

The Cryptographic Extension also provides multiply instructions that operate on long polynomials, see *PMULL, PMULL2* on page C7-1179.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## A1.7 The ARM memory model

The ARM memory model supports:

- Generating an exception on an unaligned memory access.
- Restricting access by applications to specified areas of memory.
- Translating virtual addresses provided by executing instructions into physical addresses.
- Altering the interpretation of multi-byte data between big-endian and little-endian.
- Controlling the order of accesses to memory.
- Controlling caches and address translation structures.
- Synchronizing access to shared memory by multiple PEs.

Virtual address (VA) support depends on the Execution state, as follows:

**AArch64 state**

Supports 64-bit virtual addressing, with the Translation Control Register determining the supported VA range. Execution at EL1 and EL0 supports two independent VA ranges, each with its own translation controls.

**AArch32 state**

Supports 32-bit virtual addressing, with the Translation Control Register determining the supported VA range. For execution at EL1 and EL0, system software can split the VA range into two subranges, each with its own translation controls.

The supported physical address space is IMPLEMENTATION DEFINED, and can be discovered by system software.

Regardless of the Execution state, the *Virtual Memory System Architecture* (VMSA) can translate VAs to blocks or pages of memory anywhere within the supported physical address space.

For more information, see:

**For execution in AArch64 state**

- Chapter B2 *The AArch64 Application Level Memory Model*.
- Chapter D3 *The AArch64 System Level Memory Model*.
- Chapter D4 *The AArch64 Virtual Memory System Architecture*.

**For execution in AArch32 state**

- Chapter E2 *The AArch32 Application Level Memory Model*.
- Chapter G3 *The AArch32 System Level Memory Model*.
- Chapter G4 *The AArch32 Virtual Memory System Architecture*.

# Part B

## The AArch64 Application Level Architecture

# Chapter B1
# The AArch64 Application Level Programmers' Model

This chapter gives an application level view of the ARM programmers' model. It contains the following sections:

- *About the Application level programmers' model* on page B1-58.
- *Registers in AArch64 Execution state* on page B1-59.
- *Software control features and EL0* on page B1-64.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## B1.1 About the Application level programmers' model

This chapter contains the programmers' model information required for application development.

The information in this chapter is distinct from the system information required to service and support application execution under an operating system, or higher level of system software. However, some knowledge of the system information is needed to put the Application level programmers' model into context.

Depending on the implementation choices, the architecture supports multiple levels of execution privilege, indicated by different *Exception levels* that number upwards from EL0 to EL3. EL0 corresponds to the lowest privilege level and is often described as unprivileged. The Application level programmers' model is the programmers' model for software executing at EL0. For more information see *Exception levels* on page D1-1514.

System software determines the Exception level, and therefore the level of privilege, at which software runs. When an operating system supports execution at both EL1 and EL0, an application usually runs unprivileged at EL0. This:

- Permits the operating system to allocate system resources to an application in a unique or shared manner.
- Provides a degree of protection from other processes, and so helps protect the operating system from malfunctioning software.

This chapter indicates where some system level understanding is necessary, and where relevant it gives a reference to the system level description.

Execution at any Exception level above EL0 is often referred to as privileged execution.

For more information on the system level view of the architecture refer to Chapter D1 *The AArch64 System Level Programmers' Model*.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## B1.2 Registers in AArch64 Execution state

This section describes the registers and process state visible at EL0 when executing in the AArch64 state. It includes the following:

- *Registers in AArch64 state*
- *Process state, PSTATE* on page B1-61
- *System registers* on page B1-62

### B1.2.1 Registers in AArch64 state

In the AArch64 application level view, an ARM processing element has:

**R0-R30** 31 general-purpose registers, R0 to R30. Each register can be accessed as:

- A 64-bit general-purpose register named X0 to X30.
- A 32-bit general-purpose register named W0 to W30.

See the register name mapping in Figure B1-1.

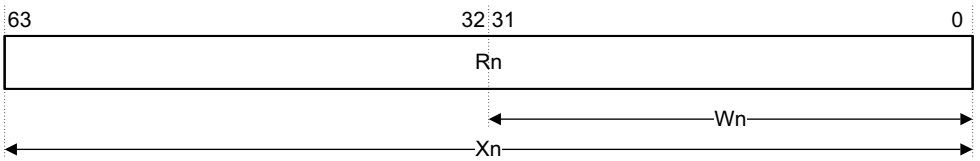

**Figure B1-1 General-purpose register naming**

The X30 general-purpose register is used as the procedure call link register.

**Note**

In instruction encodings, the value `0b11111` (31) is used to indicate the ZR (zero register). This indicates that the argument takes the value zero, but does not indicate that the ZR is implemented as a physical register.

**SP** A 64-bit dedicated Stack Pointer register. The least significant 32 bits of the stack-pointer can be accessed via the register name WSP.

The use of SP as an operand in an instruction, indicates the use of the current stack pointer.

**Note**

Stack pointer alignment to a 16-byte boundary is configurable at EL1. For more information see the *Procedure Call Standard for the ARM 64-bit Architecture*.

**PC** A 64-bit Program Counter holding the address of the current instruction.

Software cannot write directly to the PC. It can only be updated on a branch, exception entry or exception return.

**Note**

Attempting to execute an A64 instruction that is not word-aligned generates an Alignment fault, see *PC alignment checking* on page D1-1531.

**V0-V31** 32 SIMD&FP registers, V0 to V31. Each register can be accessed as:

- A 128-bit register named Q0 to Q31.
- A 64-bit register named D0 to D31.
- A 32-bit register named S0 to S31.
- A 16-bit register named H0 to H31.
- An 8-bit register named B0 to B31.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- A 128-bit vector of elements.
- A 64-bit vector of elements.

Where the number of bits described by a register name does not occupy an entire SIMD&FP register, it refers to the least significant bits. See Figure B1-2.

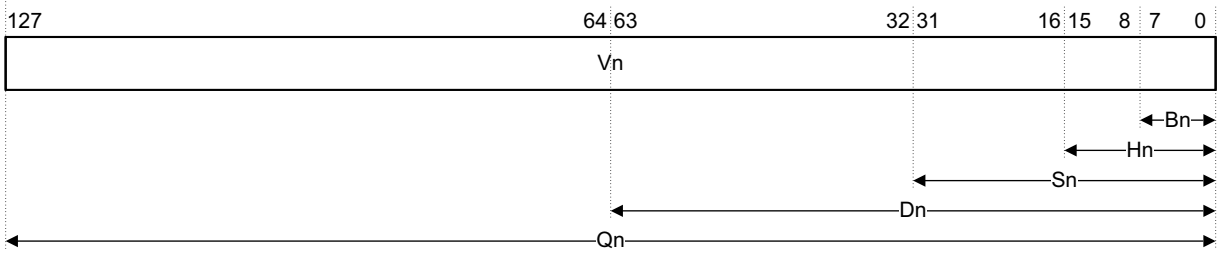

**Figure B1-2 SIMD and floating-point register naming**

For more information about data types and vector formats, see *Supported data types* on page A1-36.

**FPCR, FPSR** Two SIMD and floating-point control and status registers, FPCR and FPSR.

See *Registers for instruction processing and exception handling* on page D1-1523 for more information on the registers.

## Pseudocode description of registers in AArch64 state

In the pseudocode functions that access registers:

- The assignment form is used for register writes.
- The non-assignment for register reads.

The uses of the `X[]` function are:

- Reading or writing X0-X30, using n to index the required register.
- Reading the zero register ZR, accessed as `X[31]`.

**Note**

The pseudocode use of X[31] to represent the zero register does not indicate that hardware must implement this register.

The AArch64 `SP[]` function is used to read or write the current SP.

The AArch64 `PC[]` function is used to read the PC.

The AArch64 `V[]` function is used to read or write the Advanced SIMD and floating-point registers V0-V31, using a parameter `n` to index the required register.

The AArch64 `Vpart[]` function is used to read or write a part of one of V0-V31, using a parameter `n` to index the required register, and a parameter `part` to indicate the required part of the register, see the function description for more information.

The `SP[]`, `PC[]`, `V[]`, and `Vpart[]` functions are defined in Chapter J1 *ARMv8 Pseudocode*.

### B1.2.2 Process state, PSTATE

Process state or PSTATE is an abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

The following PSTATE information is accessible at EL0:

**The condition flags**

Flag-setting instructions set these. They are:

**N** Negative condition flag. If the result of the instruction is regarded as a two's complement signed integer, the PE sets this to:
- 1 if the result is negative.
- 0 if the result is positive or zero.

**Z** Zero condition flag. Set to:
- 1 if the result of the instruction is zero.
- 0 otherwise.

A result of zero often indicates an equal result from a comparison.

**C** Carry condition flag. Set to:
- 1 if the instruction results in a carry condition, for example an unsigned overflow that is the result of an addition.
- 0 otherwise.

**V** Overflow condition flag. Set to:
- 1 if the instruction results in an overflow condition, for example a signed overflow that is the result of an addition.
- 0 otherwise.

Conditional instructions test the N, Z, C and V condition flags, combining them with the condition code for the instruction to determine whether the instruction must be executed. In this way, execution of the instruction is conditional on the result of a previous operation. For more information about conditional execution, see *Condition flags and related instructions* on page C6-430.

**The exception masking bits**

**D** Debug exception mask bit. When EL0 is enabled to modify the mask bits, this bit is visible and can be modified. However, this bit is architecturally ignored at EL0.

**A** SError interrupt mask bit.

**I** IRQ interrupt mask bit.

**F** FIQ interrupt mask bit.

For each bit, the values are:

**0** Exception not masked.

**1** Exception masked.

Access at EL0 using AArch64 state depends on SCTLR_EL1.UMA. See *Traps to EL1 of EL0 accesses to the PSTATE.{D, A, I, F} interrupt masks* on page D1-1579.

See *Process state, PSTATE* on page D1-1529 for the system level view of PSTATE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing PSTATE fields at EL0

At EL0 using AArch64 state, PSTATE fields can be accessed using Special-purpose registers that can be directly read using the MRS instruction and directly written using the MSR (register) instructions. Table B1-1 shows the Special-purpose registers that access the PSTATE fields that hold AArch64 state when the PE is at EL0 using AArch64. All other PSTATE fields do not have direct read and write access at EL0.

**Table B1-1 Accessing PSTATE fields at EL0 using MRS and MSR (register)**

| Special-purpose register | PSTATE fields |
|---|---|
| NZCV | N, Z, C, V |
| DAIF | D, A, I, F |

Software can also use the MSR (immediate) instruction to directly write to PSTATE.{D, A, I, F}. Table B1-2 shows the MSR (immediate) operands that can directly write to PSTATE.{D, A, I, F} when the PE is at EL0 using AArch64 state.

**Table B1-2 Accessing PSTATE.{D, A, I, F} at EL0 using MSR (immediate)**

| Operand | PSTATE fields | Notes |
|---|---|---|
| DAIFSet | D, A, I, F | Directly sets any of the PSTATE.{D,A, I, F} bits to 1 |
| DAIFClr | D, A, I, F | Directly clears any of the PSTATE.{D, A, I, F} bits to 0 |

However, access to the PSTATE.{D, A, I, F} fields at EL0 using AArch64 state depends on SCTLR_EL1.UMA. *Traps to EL1 of EL0 accesses to the PSTATE.{D, A, I, F} interrupt masks* on page D1-1579.

Writes to the PSTATE fields have side-effects on various aspects of the PE operation. All of these side-effects, are guaranteed:

- Not to be visible to earlier instructions in the execution stream.
- To be visible to later instructions in the execution stream.

## B1.2.3 System registers

System registers provide support for execution control, status and general system configuration. The majority of the System registers are not accessible at EL0.

However, some System registers can be configured to allow access from software executing at EL0. Any access from EL0 to a System register with the access right disabled causes the instruction to behave as an UNDEFINED instruction. The registers that can be accessed from EL0 are:

**Cache ID registers** The CTR_EL0 and DCZID_EL0 registers provide implementation parameters for EL0 cache management support.

**Debug registers** A debug communications channel is supported by the MDCCSR_EL0, DBGDTR_EL0, DBGDTRRX_EL0 and DBGDTRTX_EL0 registers.

**Performance Monitors registers**

See *Performance Monitors support* on page B1-63.

**Thread ID registers** The TPIDR_EL0 and TPIDRRO_EL0 registers are two thread ID registers with different access rights.

**Timer registers** In ARMv8 the following operations are performed:

- Read access to the system counter clock frequency using CNTFRQ_EL0.
- Physical and virtual timer count registers, CNTPCT_EL0 and CNTVCT_EL0.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

- Physical up-count comparison, down-count value and timer control registers, CNTP_CVAL_EL0, CNTP_TVAL_EL0, and CNTP_CTL_EL0.
- Virtual up-count comparison, down-count value and timer control registers, CNTV_CVAL_EL0, CNTV_TVAL_EL0, and CNTV_CTL_EL0.

### Performance Monitors support

The ARMv8 architecture defines optional Performance Monitors.

The basic form of the Performance Monitors is:

- A 64-bit cycle counter.
- Up to a maximum of 32 IMPLEMENTATION DEFINED event counters, where the number is identified by the PMCR_EL0.N field.
- System register access to the cycle counter and event registers, and related controls for:
  - Enabling and resetting counters.
  - Flagging overflows.
  - Generating interrupts on overflow.

  Software can enable the cycle counter independently of the event counters.

Software executing at EL1 or a higher Exception level, for example an operating system, can enable access to the counters from EL0. This allows an application to monitor its own performance with fine grain control without requiring operating system support. For example, an application might implement per-function performance monitoring.

For details on the features, configuration and control of the Performance Monitors, see Chapter D5 *The Performance Monitors Extension*.

#### *EL0 access to Performance Monitors*

To allow application code to make use of the Performance Monitors, software executing at a higher Exception level must set the following bits in the PMUSERENR_EL0 System register:

**EN** When set to 1, access to all Performance Monitors registers is allowed at EL0, except for writes to PMUSERENR_EL0, and reads/writes of PMINTENSET_EL1 and PMINTENCLR_EL1.

**ER** When set to 1, read access to event counters is allowed at EL0. This includes read/write access to PMSELR_EL0, so that the event counter to read through PMXEVCNTR_EL0 can be set.

**CR** When set to 1, read access to PMCCNTR_EL0 is allowed at EL0.

**SW** When set to 1, write access to PMSWINC_EL0 is allowed at EL0.

**Note**

Register PMUSERENR_EL0 is always read-only at EL0.

## B1.3 Software control features and EL0

The following sections describe the EL0 view of the ARMv8 software control features:

- *Exception handling*
- *Wait for Interrupt and Wait for Event*
- *The YIELD instruction*
- *Application level cache management*
- *Debug events* on page B1-65

### B1.3.1 Exception handling

In the ARM architecture, an *exception* causes a change of program flow. Execution of an exception handler starts, at an Exception level higher than EL0, from a defined vector that relates to the exception taken.

Exceptions include:

- Interrupts.
- Memory system aborts.
- Undefined instructions.
- System calls.
- Secure monitor or Hypervisor traps.

Most details of exception handling are not visible to application level software, and are described in Chapter D1 *The AArch64 System Level Programmers' Model*.

The `SVC` instruction causes a Supervisor Call exception. This provides a mechanism for unprivileged software to make a system call to an operating system.

### B1.3.2 Wait for Interrupt and Wait for Event

Issuing a `WFI` instruction indicates that no further execution is required until a WFI wake-up event occurs, see *Wait For Interrupt* on page D1-1614. This permits entry to a low-power state.

Issuing a `WFE` instruction indicates that no further execution is required until a WFE wake-up event occurs, see *Wait for Event mechanism and Send event* on page D1-1611. This permits entry to a low-power state.

### B1.3.3 The YIELD instruction

The `YIELD` instruction provides a hint that the task performed by a thread is of low importance so that it could yield, see *YIELD* on page C6-833. This mechanism can be used to improve overall performance in a *Symmetric Multi-Threading* (SMT) or *Symmetric Multi-Processing* (SMP) system.

Examples of when the `YIELD` instruction might be used include a thread that is sitting in a spin-lock, or where the arbitration priority of the snoop bit in an SMP system is modified. The `YIELD` instruction permits binary compatibility between SMT and SMP systems.

The `YIELD` instruction is a NOP (No Operation) hint instruction.

The `YIELD` instruction has no effect in a single-threaded system, but developers of such systems can use the instruction to flag its intended use for future migration to a multiprocessor or multithreading system. Operating systems can use `YIELD` in places where a yield hint is wanted, knowing that it will be treated as a NOP if there is no implementation benefit.

### B1.3.4 Application level cache management

A small number of cache management instructions can be enabled at EL0 from higher levels of privilege using the SCTLR_EL1 System register. Any access from EL0 to an operation with the access right disabled causes the instruction to behave as an UNDEFINED instruction.

About the available operations, see *Application level cache instructions* on page B2-72.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### B1.3.5 Debug events

The debug logic is responsible for generating debug events. Most aspects of debug events are not visible to application level software, and are described in Chapter H1 *Introduction to External Debug*. Aspects that are visible to application level software include:

- The `BKPT` instruction, which causes a BKPT instruction debug event to occur.
- The `DBG` instruction, which provides a hint to the debug system.
- The `HLT` instruction, which causes entry to Debug state.

# Chapter B2
# The AArch64 Application Level Memory Model

This chapter gives an application level view of the memory model. It contains the following sections:

- *Address space* on page B2-68.
- *Memory type overview* on page B2-69.
- *Caches and memory hierarchy* on page B2-70.
- *Alignment support* on page B2-75.
- *Endian support* on page B2-77.
- *Atomicity in the ARM architecture* on page B2-80.
- *Memory ordering* on page B2-83.
- *Memory types and attributes* on page B2-93.
- *Mismatched memory attributes* on page B2-104.
- *Synchronization and semaphores* on page B2-107.

**Note**

In this chapter, System register names usually link to the description of the register in Chapter D7 *AArch64 System Register Descriptions*, for example SCTLR_EL1.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## B2.1 Address space

Address calculations are performed using 64-bit registers. However, supervisory software can configure the top eight address bits for use as a tag, as described in *Address tagging in AArch64 state* on page D4-1742. If this is done, address bits[63:56]:

- Are not considered when determining whether the address is valid.
- Are never propagated to the program counter.

Supervisory software determines the valid address range. Attempting to access an address that is not valid generates an MMU fault.

*Simple sequential execution* of instructions might overflow the valid address range. For more information see *Instruction address space overflow* on page D3-1705.

Memory accesses use the `Mem[]` function. This function makes an access of the required type. If supervisory software configures the top eight address bits for use as a tag, the top eight address bits are ignored.

The `AccType{}` enumeration defines the different access types.

**Note**

- Chapter D3 *The AArch64 System Level Memory Model* and Chapter D4 *The AArch64 Virtual Memory System Architecture* include descriptions of memory system features that are transparent to the application, including memory access, address translation, memory maintenance instructions, and alignment checking and the associated fault handling. These chapters also include pseudocode descriptions of these operations.
- For information on the pseudocode that relates to memory accesses, see *Basic memory access* on page D3-1731, *Unaligned memory access* on page D3-1732, and *Aligned memory access* on page D3-1731.

Non-Confidential - Beta

## B2.2 Memory type overview

ARMv8 provides the following mutually-exclusive memory types:

**Normal** This is generally used for bulk memory operations, both read/write and read-only operations.

**Device** The ARM architecture forbids speculative reads of any type of Device memory. This means Device memory types are suitable attributes for read-sensitive locations.

Locations of the memory map that are assigned to peripherals are usually assigned the Device memory attribute.

Device memory has additional attributes that have the following effects:

- They prevent aggregation of reads and writes, maintaining the number and size of the specified memory accesses. See *Gathering* on page B2-100.
- They preserve the access order and synchronization requirements, both for accesses to a single peripheral and where there is a synchronization requirement on the observability of one or more memory write and read accesses. See *Reordering* on page B2-101
- They indicate whether a write can be acknowledged other than at the end point. See *Early Write Acknowledgement* on page B2-102.

For more information on Normal memory and Device memory, see *Memory types and attributes* on page B2-93.

**Note**

Earlier versions of the ARM architecture defined a single Device memory type and a Strongly-ordered memory type. A *Note* in *Device memory* on page B2-98 describes how these memory types map onto the ARMv8 memory types.

Non-Confidential - Beta

## B2.3 Caches and memory hierarchy

The implementation of a memory system depends heavily on the microarchitecture and therefore many details of the memory system are IMPLEMENTATION DEFINED. ARMv8 defines the application level interface to the memory system, including a hierarchical memory system with multiple levels of cache. This section describes an application level view of this system. It contains the subsections:

- *Introduction to caches*.
- *Memory hierarchy*.
- *Application level cache instructions* on page B2-72
- *Implication of caches for the application programmer* on page B2-72.
- *Preloading caches* on page B2-74.

### B2.3.1 Introduction to caches

A cache is a block of high-speed memory that contains a number of entries, each consisting of:

- Main memory address information, commonly known as a *tag*.
- The associated data.

Caches increase the average speed of a memory access. Caching takes account of two principles of locality:

**Spatial locality**

An access to one location is likely to be followed by accesses to adjacent locations. Examples of this principle are:

- Sequential instruction execution.
- Accessing a data structure.

**Temporal locality**

An access to an area of memory is likely to be repeated in a short time period. An example of this principle is the execution of a software loop.

To minimize the quantity of control information stored, the spatial locality property groups several locations together under the same tag. This logical block is commonly known as a *cache line*. When data is loaded into a cache, access times for subsequent loads and stores are reduced, resulting in overall performance benefits. An access to information already in a cache is known as a *cache hit*, and other accesses are called *cache misses*.

Normally, caches are self-managing, with the updates occurring automatically. Whenever the PE accesses a cacheable memory location, the cache is checked. If the access is a cache hit, the access occurs in the cache. Otherwise, the access is made to memory. Typically, when making this access, a cache location is allocated and the cache line loaded from memory. ARMv8 permits different cache topologies and access policies, provided they comply with the memory coherency model described in this manual.

Caches introduce a number of potential problems, mainly because:

- Memory accesses can occur at times other than when the programmer would expect them.
- A data item can be held in multiple physical locations.

### B2.3.2 Memory hierarchy

Typically memory close to a PE has very low latency, but is limited in size and expensive to implement. Further from the PE it is common to implement larger blocks of memory but these have increased latency. To optimize overall performance, an ARMv8 memory system can include multiple levels of cache in a hierarchical memory system that exploits this trade-off between size and latency. Figure B2-1 on page B2-71 shows an example of such a system in an ARMv8-A system that supports virtual addressing.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

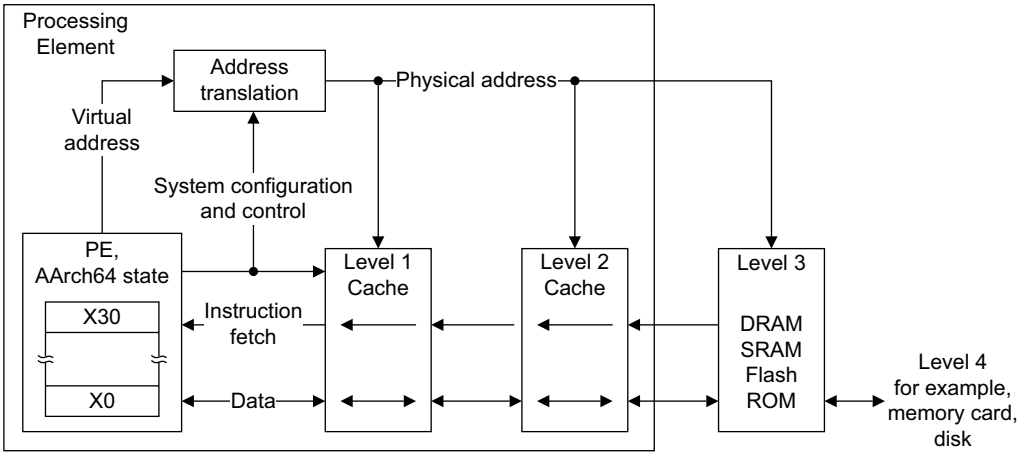

**Figure B2-1 Multiple levels of cache in a memory hierarchy**

**Note**

In this manual, in a hierarchical memory system, Level 1 refers to the level closest to the processing element, as shown in Figure B2-1.

Instructions and data can be held in separate caches or in a unified cache. A cache hierarchy can have one or more levels of separate instruction and data caches, with one or more unified caches that are located at the levels closest to the main memory. Memory coherency for cache topologies can be defined by two conceptual points:

**Point of Unification (PoU)**

The point at which the instruction cache, data cache, and translation table walks of a particular PE are guaranteed to see the same copy of a memory location. In many cases, the point of unification is the point in a uniprocessor memory system by which the instruction and data caches and the translation table walks have merged. The point of unification might coincide with the point of coherency.

**Point of Coherency (PoC)**

The point at which all agents that can access memory are guaranteed to see the same copy of a memory location. In many cases this is effectively the main system memory, although the architecture does not prohibit the implementation of caches beyond the PoC that have no effect on the coherency between memory system agents.

**Note**

The presence of system caches can affect the definition of point of coherency as described in *System level caches* on page D3-1726.

See also *Overview of the cache maintenance instructions* on page D3-1712.

## The cacheability and shareability memory attributes

Cacheability and shareability are two attributes that describe the memory hierarchy in a multiprocessing system:

**Cacheability** This attribute defines whether memory locations are allowed to be allocated into a cache or not. Cacheability is defined independently for Inner and Outer cacheability locations.

**Shareability** This attribute defines whether memory locations are shareable between different agents in a system. Marking a memory location as shareable for a particular domain requires hardware to ensure that the location is coherent for all agents in that domain. Shareability is defined independently for Inner and Outer shareability domains.

For more information about cacheability and shareability see *Memory types and attributes* on page B2-93.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### B2.3.3 Application level cache instructions

In the ARM architecture, the application level is defined as *Exception level 0* (EL0). The architecture defines a set of cache maintenance instructions that software can use to manage cache coherency. Software executing at a higher Exception level can enable EL0 access to the following:

- The data cache maintenance instructions, `DC CVAU`, `DC CVAC`, and `DC CIVAC`. See *Data cache maintenance instructions (DC*)* on page D3-1717.
- The instruction cache maintenance instruction, `IC IVAU`. See *Instruction cache maintenance instructions (IC*)* on page D3-1717.
- The cache type register. See CTR_EL0.
- The data cache zero instruction, `DC ZVA`. See *Data cache zero instruction* on page D3-1724.

These instructions are UNDEFINED from EL0 unless software executing at a higher Exception level has enabled them. See *Cache maintenance instructions* on page D3-1716.

For all of these instructions, if the addresses do not have read access permission at EL0, executing these instructions at EL0 generates a Permission fault.

For more information about the system controls, see *Cache support* on page D3-1707.

### B2.3.4 Implication of caches for the application programmer

In normal operation, the caches are largely invisible to the application programmer. However they can become visible when there is a breakdown in the coherency of the caches. Such a breakdown can occur:

- When memory locations are updated by other agents in the system that do not use hardware management of coherency.
- When memory updates made from the application software must be made visible to other agents in the system, without the use of hardware management of coherency.

For example:

- In the absence of hardware management of coherency of DMA accesses, in a system with a DMA controller that reads memory locations that are held in the data cache of a PE, a breakdown of coherency occurs when the PE has written new data in the data cache, but the DMA controller reads the old data held in memory.
- In a Harvard cache implementation, where there are separate instruction and data caches, a breakdown of coherency occurs when new instruction data has been written into the data cache, but the instruction cache still contains the old instruction data.

#### Data coherency issues

Software can ensure the data coherency of caches in the following ways:

- By not using the caches in situations where coherency issues can arise. This can be achieved by:
  - Using Non-cacheable or, in some cases, Write-Through Cacheable memory.
  - Not enabling caches in the system.
- By using cache maintenance instructions to manage the coherency issues in software. See *Application level cache instructions*.
- By using hardware coherency mechanisms to ensure the coherency of data accesses to memory for cacheable locations by observers within the different shareability domains, see *Non-shareable Normal memory* on page B2-95 and *Shareable, Inner Shareable, and Outer Shareable Normal memory* on page B2-94.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

The performance of these hardware coherency mechanisms is highly implementation-specific. In some implementations the mechanism suppresses the ability to cache shareable locations. In other implementations, cache coherency hardware can hold data in caches while managing coherency between observers within the shareability domains.

**Note**

Not all these mechanisms are directly available to software operating at EL0 and might involve interaction with software operating at a higher Exception level.

### Synchronization and coherency issues between data and instruction accesses

How far ahead of the current point of execution instructions are fetched from is IMPLEMENTATION DEFINED. Such prefetching can be either a fixed or a dynamically varying number of instructions, and can follow any or all possible future execution paths. For all types of memory:

- The PE might have fetched the instructions from memory at any time since the last *Context synchronization operation* on that PE.
- Any instructions fetched in this way might be executed multiple times, if this is required by the execution of the program, without being refetched from memory. In the absence of an `ISB`, there is no limit on the number of times such an instruction might be executed without being refetched from memory.

The ARM architecture does not require the hardware to ensure coherency between instruction caches and memory, even for locations of shared memory.

If software requires coherency between instruction execution and memory, it must manage this coherency using the `ISB` and `DSB` memory barriers and cache maintenance instructions. The following code sequence can be used to allow a PE to execute code that the same PE has written.

```
; Coherency example for data and instruction accesses within the same Inner Shareable domain.
; Enter this code with <Wt> containing a new 32-bit instruction,
; to be held in Cacheable space at a location pointed to by Xn.
        STR Wt, [Xn]
        DC CVAU, Xn         ; Clean data cache by VA to point of unification (PoU)
        DSB ISH             ; Ensure visibility of the data cleaned from cache
        IC IVAU, Xn         ; Invalidate instruction cache by VA to PoU
        DSB ISH             ; Ensure completion of the invalidations
        ISB                 ; Synchronize the fetched instruction stream
```

**Note**

- For Non-cacheable or Write-Through accesses, the clean data cache by VA instruction is not required. However, the invalidate instruction cache instruction is required because the ARMv8-A AArch64 architecture allows Non-cacheable accesses to be held in an instruction cache. See *Non-cacheable accesses and instruction caches* on page D3-1712.
- This code can be used when the thread of execution modifying the code is the same thread of execution that is executing the code. The ARMv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization. See *Concurrent modification and execution of instructions* on page B2-82.
- The system software controls whether these cache maintenance instructions are available to the application level by setting SCTLR_EL1.UCI.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

If this sequence is not executed between writing data to a location and executing the instruction at that location, the lack of coherency between instruction caches and memory means that the instructions that are executed might be the old instruction or the updated instruction, and which is used can arbitrarily vary during execution. It must not be assumed by software, before the synchronization sequence is executed, that once the updated instruction has been seen, the old instruction will not be seen again.

### B2.3.5 Preloading caches

The ARM architecture provides memory system hints `PRFM`, `LDNP`, and `STNP` that software can use to communicate the expected use of memory locations to the hardware. The memory system can respond by taking actions that are expected to speed up the memory accesses if they occur. The effect of these memory system hints is IMPLEMENTATION DEFINED. Typically, implementations use this information to bring the data or instruction locations into caches.

The Preload instructions are hints, and so implementations can treat them as `NOP`s without affecting the functional behavior of the device. The instructions cannot generate synchronous Data Abort exceptions, but the resulting memory system operations might, under exceptional circumstances, generate an asynchronous external abort, which is taken using an SError interrupt exception. For more information, see *Exception from a Data abort* on page D1-1549.

`PrefetchHint{}` defines the prefetch hint types.

The `Hint_Prefetch()` function signals to the memory system that memory accesses of the type `hint` to or from the specified `address` are likely to occur in the near future. The memory system might take some action to speed up the memory accesses when they do occur, such as preloading the specified address into one or more caches as indicated by the innermost cache level `target` and non-temporal hint `stream`.

For more information on `PRFM` and Load/Store instructions that provide hints to the memory system, see *Prefetch memory* on page C3-151 and *Load/Store SIMD and Floating-point Non-temporal pair* on page C3-149.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## B2.4 Alignment support

This section describes alignment support. It contains the following subsections:

- *Instruction alignment*.
- *Alignment of data accesses*.
- *Unaligned data access restrictions* on page B2-76.

### B2.4.1 Instruction alignment

A64 instructions must be word-aligned.

Attempting to fetch an instruction from a misaligned location results in a Misaligned PC fault. See *PC alignment checking* on page D1-1531.

### B2.4.2 Alignment of data accesses

An unaligned access to any type of Device memory causes an Alignment fault.

The alignment requirements for accesses to Normal memory are as follows:

- For all instructions that load or store a single or multiple registers, other than Load-Exclusive/Store-Exclusive and Load-Acquire/Store-Release, if the address that is accessed is not aligned to the size of the data element being accessed, then one of the following occurs:
  - An Alignment fault is generated.
  - An unaligned access is performed.

  When the value of SCTLR_ELx.A at the current Exception level is 1, alignment checking is enabled, and unaligned accesses generate Alignment faults.

  **Note**

  - The SCTLR_EL1.A bit applies to software running at EL0 and at EL1, although it can only be accessed from EL1 and higher.
  - Alignment checks are based on the size of the accessed elements, not the overall access size. This affects SIMD element and structure loads and stores, and also Load/Store pair instructions.
  - These alignment checking rules mean the ARMv8 architecture introduces requirements for 64-bit and 128-bit alignment checking.

- For all Load-Exclusive/Store-Exclusive and Load-Acquire/Store-Release memory accesses that access a single element or a pair of elements, an Alignment fault is generated if the address being accessed is not aligned to the size of the data structure being accessed.

A failed alignment check results in an Alignment fault, which is taken as a Data Abort exception, that is taken as follows:

- For an access from Non-secure EL0 or EL1, if the Alignment fault is generated only because the translation tables identify the address being accessed as Device memory then:
  - If the first stage of address translation marks the address as Device memory then the exception is taken to EL1.
  - If only the second stage of address translation marks the address as Device memory then the exception is taken to EL2.
- Otherwise, the exception is taken to the lowest Exception level that can handle the exception, consistent with the basic requirement that the Exception level never decreases on taking an exception. Therefore:
  - Alignment faults taken from EL0 or EL1 are taken to EL1 unless redirected by HCR_EL2.TGE
  - Alignment faults taken from EL2 are taken to EL2.
  - Alignment faults taken from EL3 are taken to EL3.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### B2.4.3 Unaligned data access restrictions

The following points apply to unaligned data accesses in ARMv8:

- Accesses are not guaranteed to be single-copy atomic except at the byte access level, see *Atomicity in the ARM architecture* on page B2-80.
- Unaligned accesses typically take a number of additional cycles to complete compared to a naturally-aligned access.
- An operation that performs an unaligned access can abort on any memory access that it makes, and can abort on more than one access. This means that an unaligned access that occurs across a page boundary can generate an abort on either side of the boundary.

## B2.5 Endian support

*General description of endianness in the ARM architecture* describes the relationship between endianness and memory addressing in the ARM architecture.

The following subsections then describe the endianness schemes supported by the architecture:

- *Instruction endianness* on page B2-78.
- *Data endianness* on page B2-78.

### B2.5.1 General description of endianness in the ARM architecture

This section only describes memory addressing and the effects of endianness for data elements up to quadwords of 128 bits. However, this description can be extended to apply to larger data elements.

For an address A, Figure B2-2 shows, for big-endian and little-endian memory systems, the relationship between:

- The quadword at address A.
- The doubleword at address A and A+8.
- The words at addresses A, A+4, A+8, and A+12.
- The halfwords at addresses A, A+2, A+4, A+6, A+8, A+10, A+12, and A+14.
- The bytes at addresses A, A+1, A+2, A+3, A+4, A+5, A+6, A+7, A+8, A+9, A+10, A+11, A+12, A+13, A+14, and A+15.

The terms in Figure B2-2 have the following definitions:

**B_A** Byte at address A.
**HW_A** Halfword at address A.
**MSByte** Most-significant byte.
**LSByte** Least-significant byte.

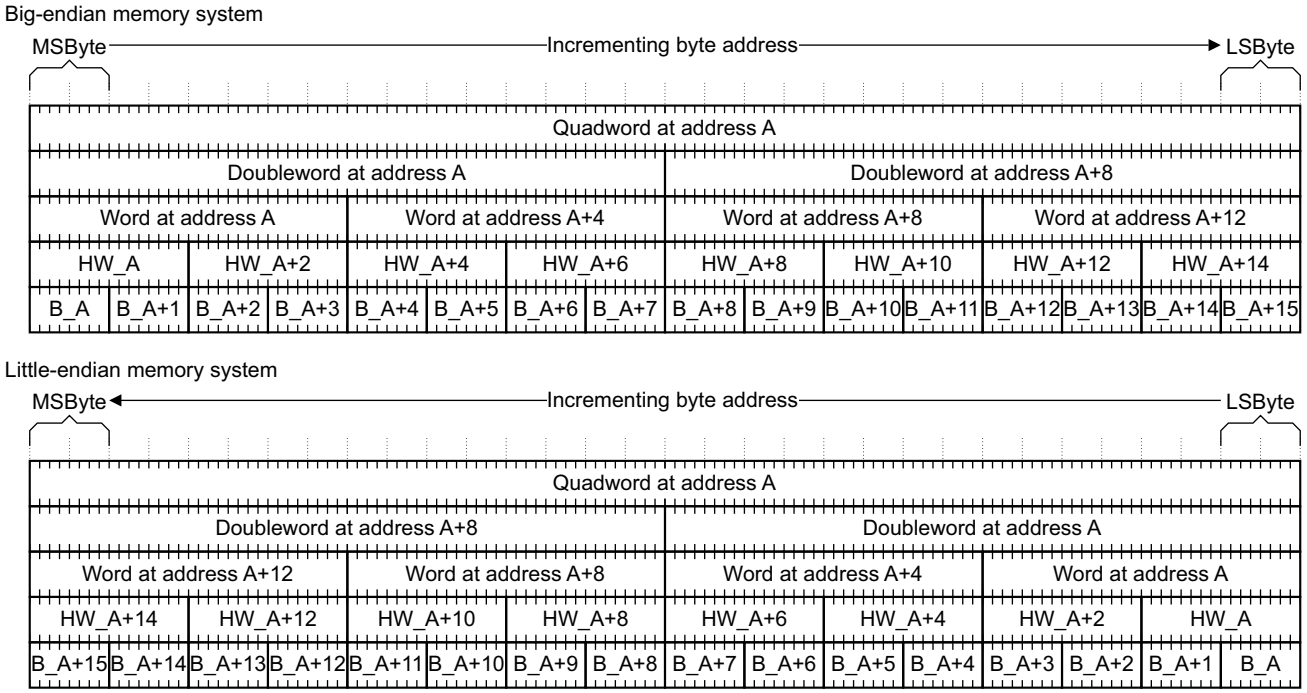

**Figure B2-2 Endianness relationships**

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The big-endian and little-endian mapping schemes determine the order in which the bytes of a quadword, doubleword, word or halfword are interpreted. For example, a load of a word from address `0x1000` always results in an access to the bytes at memory locations `0x1000`, `0x1001`, `0x1002`, and `0x1003`. The endianness mapping scheme determines the significance of these four bytes.

### B2.5.2 Instruction endianness

In ARMv8-A, A64 instructions have a fixed length of 32 bits and are always little-endian.

### B2.5.3 Data endianness

SCTLR_EL1.E0E, configurable at EL1 or higher, determines the data endianness for execution at EL0.

The data size used for endianness conversions:

- Is the size of the data value that is loaded or stored for SIMD and floating-point register and general-purpose register loads and stores.
- Is the size of the data element that is loaded or stored for SIMD element and data structure loads and stores. For more information see *Endianness in SIMD operations* on page B2-79.

**Note**

This means the ARMv8 architecture introduces a requirement for 128-bit endian conversions.

#### Instructions to reverse bytes in a general-purpose register or a SIMD and floating-point register

An application or device driver might have to interface to memory-mapped peripheral registers or shared memory structures that are not the same endianness as the internal data structures. Similarly, the endianness of the operating system might not match that of the peripheral registers or shared memory. In these cases, the PE requires an efficient method to transform explicitly the endianness of the data.

Table B2-1 shows the instructions that provide this functionality:

**Table B2-1 Byte reversal instructions**

| Function | Instructions | Notes |
|---|---|---|
| Reverse bytes in 32-bit word or words[a] | REV32 | For use with general-purpose registers |
| Reverse bytes in whole register | REV | For use with general-purpose registers |
| Reverse bytes in 16-bit halfwords | REV16 | For use with general-purpose registers |
| Reverse elements in doublewords, vector | REV64 | For use with SIMD and floating-point registers |
| Reverse elements in words, vector | REV32 | For use with SIMD and floating-point registers |
| Reverse elements in halfwords, vector | REV16 | For use with SIMD and floating-point registers |

a. Can operate on multiple words.

Non-Confidential - Beta

### Endianness in SIMD operations

SIMD element Load/Store instructions transfer vectors of elements between memory and the SIMD and floating-point register file. An instruction specifies both the length of the transfer and the size of the data elements being transferred. This information is used to load and store data correctly in both big-endian and little-endian systems.

For example:

```
LD1 {V0.4H}, [X1]
```

This loads a 64-bit register with four 16-bit values. The four elements appear in the register in array order, with the lowest indexed element fetched from the lowest address. The order of bytes in the elements depends on the endianness configuration, as shown in Figure B2-3. Therefore, the order of the elements in the registers is the same regardless of the endianness configuration.

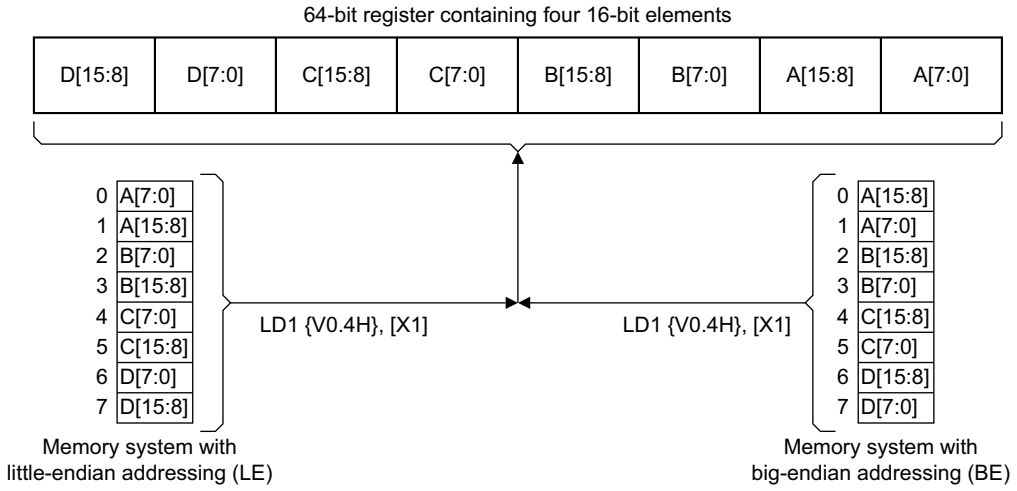

**Figure B2-3 SIMD byte order example**

The `BigEndian()` pseudocode function determines the current endianness of the data.

The `BigEndianReverse()` pseudocode function reverses the endianness of a bitstring.

The `BigEndian()` and `BigEndianReverse()` functions are defined in Chapter J1 *ARMv8 Pseudocode*.

## B2.6 Atomicity in the ARM architecture

*Atomicity* is a feature of memory accesses, described as *atomic* accesses. The ARM architecture description refers to two types of atomicity, *single-copy atomicity* and *multicopy atomicity*. In the ARMv8 architecture, the atomicity requirements for memory accesses depend on the memory type, and whether the access is explicit or implicit. For more information see:

- *Requirements for single-copy atomicity*.
- *Properties of single-copy atomic accesses* on page B2-81.
- *Multi-copy atomicity* on page B2-81.
- *Requirements for multi-copy atomicity* on page B2-81.

For more information about the memory types, see *Memory type overview* on page B2-69.

### B2.6.1 Requirements for single-copy atomicity

For explicit memory accesses generated from an Exception level the following rules apply:

- All reads generated by load instructions that load a single general-purpose register and that are aligned to the size of the read in that instruction are single-copy atomic.
- All writes generated by store instructions that store a single general-purpose register and that are aligned to the size of the write in that instruction are single-copy atomic.
- Reads of general-purpose registers generated by Load Pair instructions that are aligned to the size of the load to each register are treated as two single-copy atomic reads, one for each register being loaded.
- Writes of general-purpose registers generated by Store pair instructions that are aligned to the size of the store of each register are treated as two single-copy atomic writes, one for each register being stored.
- Load-Exclusive Pair instructions of two 32-bit quantities and Store-Exclusive Pair instructions of 32-bit quantities are single-copy atomic.
- When the Store-Exclusive of a Load-Exclusive/Store-Exclusive pair instruction using two 64-bit quantities succeeds, it causes a single-copy atomic update of the entire memory location being updated.

  **Note**

  To atomically load two 64-bit quantities, perform a Load-Exclusive pair/Store-Exclusive pair sequence of reading and writing the same value for which the Store-Exclusive pair succeeds, and use the read values from the Load-Exclusive pair.

- Where translation table walks generate a read of a translation table entry, this read is single-copy atomic.
- For the atomicity of instruction fetches, see *Concurrent modification and execution of instructions* on page B2-82.
- Reads to floating-point and SIMD registers of a single 64-bit or smaller quantity that is aligned to the size of the quantity being loaded are treated as single-copy atomic reads.
- Writes from floating-point and SIMD registers of a single 64-bit or smaller quantity that is aligned to the size of the quantity being stored are treated as single-copy atomic writes.
- Element or Structure Reads to floating-point and SIMD registers of 64-bit or smaller elements, where each element is aligned to the size of the element being loaded, have each element treated as a single-copy atomic read.
- Element or Structure Writes from floating-point and SIMD registers of 64-bit or smaller elements, where each element is aligned to the size of the element being stored, have each element treated as a single-copy atomic store.
- Reads to floating-point and SIMD registers of a 128-bit value that is 64-bit aligned in memory are treated as a pair of single-copy atomic 64-bit reads.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Writes from floating-point and SIMD registers of a 128-bit value that is 64-bit aligned in memory are treated as a pair of single-copy atomic 64-bit writes.

All other memory accesses are regarded as streams of accesses to bytes, and no atomicity between accesses to different bytes is ensured by the architecture.

All accesses to any byte are single-copy atomic.

**Note**

In AArch64 state, no memory accesses from a DC ZVA have single-copy atomicity of any quantity greater than individual bytes.

If, according to these rules, an instruction is executed as a sequence of accesses, exceptions, including interrupts, can be taken during that sequence, regardless of the memory type being accessed. If any of these exceptions are returned from using their preferred return address, the instruction that generated the sequence of accesses is re-executed, and so any access performed before the exception was taken is repeated. See also *Taking an interrupt or other exception during a multiple-register load or store* on page D1-1574.

**Note**

The exception behavior for these multiple access instructions means they are not suitable for use for writes to memory for the purpose of software synchronization.

### B2.6.2 Properties of single-copy atomic accesses

A read or write operation that is *single-copy atomic* has the following properties:

1. For a single-copy atomic store, if the store overlaps another single-copy atomic store, then all of the writes from one of the stores are inserted into the Coherence order of each overlapping byte before any of the writes of the other store are inserted into the Coherence orders of the overlapping bytes.
2. If a single-copy atomic load overlaps a single-copy atomic store and for any of the overlapping bytes the load returns the data written by the write inserted into the Coherence order of that byte by the single-copy atomic store then the load must return data from a point in the Coherence order no earlier than the writes inserted into the Coherence order by the single-copy atomic store of all of the overlapping bytes.

### B2.6.3 Multi-copy atomicity

In a multiprocessing system, writes to a memory location are *multi-copy atomic* if the following conditions are both true:

- All writes to the same location are *serialized*, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes.
- A read of a location does not return the value of a write until all observers observe that write.

**Note**

Writes that are not coherent are not multi-copy atomic.

### B2.6.4 Requirements for multi-copy atomicity

In a multiprocessing system, coherent writes to a memory location are multi-copy atomic if the read of a location returns the value of a write only when all observers have observed that write.

For Normal memory, writes are not required to be multi-copy atomic.

For Device memory with the non-Gathering attribute, writes that are single-copy atomic are also multi-copy atomic.

For Device memory with the Gathering attribute, writes are not required to be multi-copy atomic.

Non-Confidential - Beta

### B2.6.5 Concurrent modification and execution of instructions

The ARMv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization.

Concurrent modification and execution of instructions can lead to the resulting instruction performing any behavior that can be achieved by executing any sequence of instructions that can be executed from the same Exception level, except where the instruction before modification and the instruction after modification is a `B`, `BL`, `NOP`, `BRK`, `SVC`, `HVC`, or `SMC` instruction.

For the `B`, `BL`, `NOP`, `BRK`, `SVC`, `HVC`, and `SMC` instructions the architecture guarantees that, after modification of the instruction, behavior is consistent with execution of either:

- The instruction originally fetched.
- A fetch of the modified instruction.

If one thread of execution changes a conditional branch instruction, such as `B` or `BL`, to another conditional instruction and the change affects both the condition field and the branch target, execution of the changed instruction by another thread of execution before the change is synchronized can lead to either:

- The old condition being associated with the new target address.
- The new condition being associated with the old target address.

These possibilities apply regardless of whether the condition, either before or after the change to the branch instruction, is the *always* condition.

For all other instructions, to avoid UNPREDICTABLE behavior, instruction modifications must be explicitly synchronized before they are executed. The required synchronization is as follows:

1. No PE must be executing an instruction when another PE is modifying that instruction.

2. To ensure that the modified instructions are observable, the PE that modified the instructions must issue the following sequence of instructions and operations:

```
; Coherency example for data and instruction accesses within the same Inner Shareable domain.
; Enter this code with <Wt> containing a new 32-bit instruction,
; to be held in Cacheable space at a location pointed to by Xn.
        STR Wt, [Xn]
        DC CVAU, Xn         ; Clean data cache by VA to point of unification (PoU)
        DSB ISH             ; Ensure visibility of the data cleaned from cache
        IC IVAU, Xn         ; Invalidate instruction cache by VA to PoU
        DSB ISH             ; Ensure completion of the invalidations
```

**Note**

The `DC CVAU` operation is not required if the area of memory is either Non-cacheable or Write-through Cacheable.

3. In a multiprocessor system, the `IC IVAU` is broadcast to all PEs within the Inner Shareable domain of the PE running this sequence. However, when the modified instructions are observable, each PE that is executing the modified instructions must issue the following instruction to ensure execution of the modified instructions:

```
ISB                             ; Synchronize fetched instruction stream
```

For more information about the required synchronization operation, see *Synchronization and coherency issues between data and instruction accesses* on page B2-73.

**Note**

For information about memory accesses caused by instruction fetches, see *Ordering requirements* on page B2-84.

## B2.7 Memory ordering

This section describes observation ordering. It contains the following subsections:

- *Observability and completion*.
- *Ordering requirements* on page B2-84.
- *Memory barriers* on page B2-86.
- *Summary of the memory ordering rules* on page B2-90.

For information on endpoint ordering of memory accesses, see *Reordering* on page B2-101.

In the ARMv8 memory model, the shareability memory attribute indicates whether hardware must ensure memory coherency.

The ARMv8 memory system architecture defines additional attributes and associated behaviors, defined in the system level section of this manual. See:

- Chapter D3 *The AArch64 System Level Memory Model*.
- Chapter D4 *The AArch64 Virtual Memory System Architecture*.

See also *Mismatched memory attributes* on page B2-104.

### B2.7.1 Observability and completion

An *observer* is a master in the system that is capable of observing memory accesses. For a PE, the following mechanisms must be treated as independent observers:

- The mechanism that performs reads or writes to memory.
- A mechanism that causes an instruction cache to be filled from memory or that fetches instructions to be executed directly from memory. These are treated as reads.
- A mechanism that performs translation table walks. These are treated as reads.

The set of observers that can observe a memory access is defined by the system.

In the definitions in this subsection, *subsequent* means whichever of the following is appropriate to the context:

- After the point in time where the location is observed by that observer.
- After the point in time where the location is globally observed.

For all memory:

- A write to a location in memory is said to be *observed* by an observer when:
  - A subsequent read of the location by the same observer returns the value written by the observed write, or written by a write to that location by any observer that is sequenced in the *Coherence order* of the location after the observed write.
  - A subsequent write of the location by the same observer is sequenced in the *Coherence order* of the location after the observed write.
- A write to a location in memory is said to be *globally observed* for a shareability domain or set of observers when:
  - A subsequent read of the location by any observer in that shareability domain returns the value written by the globally observed write, or written by a write to that location by any observer that is sequenced in the *Coherence order* of the location after the globally observed write.
  - A subsequent write of the location by any observer in that shareability domain is sequenced in the *Coherence order* of the location after the globally observed write.
- A read of a location in memory is said to be observed by an observer when a subsequent write to the location by the same observer has no effect on the value returned by the read.
- A read of a location in memory is said to be globally observed for a shareability domain when a subsequent write to the location by any observer in that shareability domain has no effect on the value returned by the read.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Additionally, for Device-nGnRnE memory:

- A read or write of a memory-mapped location in a peripheral that exhibits side-effects is said to be observed, and globally observed, only when the read or write:
  - Meets the general conditions listed.
  - Can begin to affect the state of the memory-mapped peripheral.
  - Can trigger all associated side-effects, whether they affect other peripheral devices, PEs, or memory.

  **Note**

  This definition is consistent with the memory access having reached the peripheral.

For all memory, the completion rules are defined as:

- A read or write is complete for a shareability domain when all of the following are true:
  - The read or write is globally observed for that shareability domain.
  - Any translation table walks associated with the read or write are complete for that shareability domain.
- A translation table walk is complete for a shareability domain when the memory accesses associated with the translation table walk are globally observed for that shareability domain, and the TLB is updated.
- A cache or TLB maintenance instruction is complete for a shareability domain when the effects of the instruction are globally observed for that shareability domain, and any translation table walks that arise from the instruction are complete for that shareability domain.

  The completion of any cache or TLB maintenance instruction includes its completion on all PEs that are affected by both the instruction and the `DSB` operation that is required to guarantee visibility of the maintenance instruction.

#### Completion of side-effects of accesses to Device memory

The completion of a memory access to Device memory other than Device-nGnRnE is not guaranteed to be sufficient to determine that the side-effects of the memory access are visible to all observers. The mechanism that ensures the visibility of side-effects of a memory access is IMPLEMENTATION DEFINED.

### B2.7.2 Ordering requirements

ARMv8 defines restrictions for the permitted ordering of memory accesses. These restrictions depend on the memory type of the addresses that are accessed, see *Memory types and attributes* on page B2-93.

**Note**

See *Summary of the memory ordering rules* on page B2-90 for the definition of *address dependency*.

The only stores by an observer that can be observed by another observer are those stores that have been *Architecturally executed*. Speculative writes by an observer cannot be observed by another observer. For the purposes of this requirement, speculative writes are all of:

- Writes generated by store instructions that appear in the *Execution stream* after a branch that is not architecturally resolved.
- Writes generated by store instructions that appear in the *Execution stream* after an instruction where a synchronous exception condition has not been architecturally resolved.
- Writes generated by conditional store instructions for which the conditions for the instruction have not been architecturally resolved.
- Writes generated by store instructions for which the data being written comes from a register that has not been architecturally committed.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The following additional restrictions apply to the order in which accesses to memory are observed:

- Reads and writes to different addresses can be observed in any order provided the following constraints are met:
  - If an address dependency exists between two reads or between a read and a write, then those memory accesses are observed in program order by all observers within the common shareability domain of the memory addresses being accessed.

    The ARMv8 architecture relaxes this rule for execution where the second read is generated by a Load Non-Temporal Pair instruction. See *Load/Store Non-temporal Pair* on page C3-145 and *Load/Store SIMD and Floating-point Non-temporal pair* on page C3-149.
  - Ordering can be achieved by using a `DMB` or `DSB` barrier. For more information on `DMB` and `DSB` instructions, see *Memory barriers* on page B2-86.
- Reads and writes to the same address are coherent within the shareability domain of the memory address being accessed.
- Two reads to the same address by the same observer are observed in program order by all observers within the shareability domain of the memory address being accessed.
- Writes are not required to be multi-copy atomic. This means that in the absence of barriers, the observation of a store by one observer does not imply the observation of the store by another observer.
- Instructions that access multiple elements have no defined ordering requirements for the memory accesses relative to each other.

For Device memory with the non-Reordering attribute, the order of memory accesses arriving at a *single peripheral* is the same as occurs in a *Simple sequential execution* on page Glossary-5775 of the program. This means the accesses arrive in program order. This ordering applies for all accesses using any of the memory types with the non-Reordering attribute, which means Device-nGnRE accesses are ordered with respect to Device-nGnRnE accesses to the same peripheral. If the memory accesses are not to a peripheral then there are no ordering restrictions from the non-Reordering attribute. For the purposes of this definition, a *single peripheral* is a region of memory of an IMPLEMENTATION DEFINED size that is defined by the peripheral.

Memory accesses caused by instruction fetches are not required to be observed in program order, unless they are separated by an `ISB` or other context synchronization event.

### Address dependencies and order

In the ARMv8 architecture, a register data dependency between the value returned by a load instruction and the address used by a subsequent memory transaction creates order between that load instruction and the subsequent memory transaction.

A register data dependency exists between a first data value and a second data value when either:

- The register, excluding the zero register (XZR or WZR), used to hold the first data value is used in the calculation of the second data value, and the calculation between the first data value and the second data value does not consist of either:
  - A conditional branch whose condition is determined by the first data value.
  - A conditional selection, move, or computation whose condition is determined by the first data value, where the input data values for the selection, move, or computation do not have a data dependency on the first data value.
- There is a register data dependency between the first data value and a third data value, and between the third data value and the second data value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

A register data dependency can exist even if the value of the first data value is discarded as part of the calculation, as might be the case if it is ANDed with `0x0` or if arithmetic using the first data value cancels out its contribution.

For example, each of the following code sequences creates order between the memory transactions:

**Sequence 1**
```
LDR X1, [X2]
AND X1, X1, XZR
LDR X4, [X3, X1]
```

**Sequence 2**
```
LDR X1, [X2]
ADD X3, X3, X1
SUB X3, X3, X1
STR X4, [X3]
```

#### *Address dependencies of Load Non-temporal Pair instructions*

Where an address dependency exists between two reads, and the second read was generated by a Load Non-temporal Pair instruction, then in the absence of any other barrier mechanism to achieve order, those memory accesses can be observed in any order by other observers within the shareability domain of the memory addresses being accessed.

This affects the following instruction:

- *LDNP* on page C6-552.

### B2.7.3 Memory barriers

The ARM architecture is a weakly ordered memory architecture that supports out of order completion. *Memory barrier* is the general term applied to an instruction, or sequence of instructions, that forces synchronization events by a PE with respect to retiring Load/Store instructions. The memory barriers defined by the ARMv8 architecture provide a range of functionality, including:

- Ordering of Load/Store instructions.
- Completion of Load/Store instructions.
- Context synchronization.

The following subsections describe the ARMv8 memory barrier instructions:

- *Instruction Synchronization Barrier (ISB)* on page B2-87
- *Data Memory Barrier (DMB)* on page B2-87.
- *Data Synchronization Barrier (DSB)* on page B2-88.
- *Shareability and access limitations on the data barrier operations* on page B2-89.
- *Load-Acquire, Store-Release* on page B2-89.

**Note**

Depending on the required synchronization, a program might use memory barriers on their own, or it might use them in conjunction with cache maintenance and memory management instructions that in general are only available when software execution is at EL1 or higher.

The `DMB` and `DSB` memory barriers affect reads and writes to the memory system generated by Load/Store instructions and data or unified cache maintenance instructions being executed by the PE. Instruction fetches or accesses caused by a hardware translation table access are not explicit accesses.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Instruction Synchronization Barrier (ISB)

An ISB instruction flushes the pipeline in the PE, so that all instructions that come after the ISB instruction in program order are fetched from the cache or memory only after the ISB instruction has completed. Using an ISB ensures that the effects of context-changing operations executed before the ISB are visible to the instructions fetched after the ISB instruction. Examples of context-changing operations that require the insertion of an ISB instruction to ensure the effects of the operation are visible to instructions fetched after the ISB instruction are:

- Completed cache and TLB maintenance instructions.
- Changes to System registers.

Any context-changing operations appearing in program order after the ISB instruction only take effect after the ISB has been executed.

The pseudocode function for the operation of an ISB is `InstructionSynchronizationBarrier()`.

See also *Memory barriers* on page D3-1738.

### Data Memory Barrier (DMB)

The DMB instruction is a data memory barrier. The PE that executes the DMB instruction is referred to as the executing PE, PEe. The DMB instruction takes an `<option>` argument that specifies the shareability domains and access types to which the instruction applies, see *Shareability and access limitations on the data barrier operations* on page B2-89.

If the required shareability is *Full system* then the operation applies to all observers within the system.

A DMB creates two groups of memory accesses, Group A and Group B:

**Group A** Contains:

- All explicit memory accesses of the required access types from observers in the same required shareability domain as PEe that are observed by PEe before the DMB instruction. These accesses include any accesses of the required access types performed by PEe.
- All loads of required access types from an observer PEx in the same required shareability domain as PEe that have been observed by any given different observer, PEy, in the same required shareability domain as PEe before PEy has performed a memory access that is a member of Group A.

**Group B** Contains:

- All explicit memory accesses of the required access types by PEe that occur in program order after the DMB instruction.
- All explicit memory accesses of the required access types by any given observer PEx in the same required shareability domain as PEe that can only occur after a load by PEx has returned the result of a store that is a member of Group B.

Any observer with the same required shareability domain as PEe observes all members of Group A before it observes any member of Group B to the extent that those group members are required to be observed, as determined by the shareability and cacheability of the memory addresses accessed by the group members.

If members of Group A and members of Group B access the same memory-mapped peripheral of arbitrary system-defined size, then members of Group A that are accessing Device or Normal Non-cacheable memory arrive at that peripheral before members of Group B that are accessing Device or Normal Non-cacheable memory. Where the members of Group A and Group B that must be ordered are from the same PE, a `DMB NSH` is sufficient for this guarantee.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

- A memory access might be in neither Group A nor Group B. The DMB does not affect the order of observation of such a memory access.
- The second part of the definition of Group A is recursive. Ultimately, membership of Group A derives from the observation by PEy of a load before PEy performs an access that is a member of Group A as a result of the first part of the definition of Group A.
- The second part of the definition of Group B is recursive. Ultimately, membership of Group B derives from the observation by any observer of an access by PEe that is a member of Group B as a result of the first part of the definition of Group B.

DMB only affects memory accesses and the operation of data cache and unified cache maintenance instructions, see *Cache maintenance instructions* on page D3-1716. It has no effect on the ordering of any other instructions executing on the PE. A DMB instruction intended to ensure the completion of cache maintenance instructions must have an access type of both loads and stores.

The pseudocode function for the operation of a DMB is `DataMemoryBarrier()`.

See also *Memory barriers* on page D3-1738.

### Data Synchronization Barrier (DSB)

The DSB instruction is a memory barrier, that synchronizes the execution stream with memory accesses.

The DSB instruction takes an <option> argument that specifies the shareability domains and access types to which the instruction applies, see *Shareability and access limitations on the data barrier operations* on page B2-89.

If the required shareability is *Full system* then the operation applies to all observers within the system.

A DSB behaves as a DMB with the same arguments, and also has the additional properties defined in this section. The PE that executes the DSB instruction is referred to as the executing PE, PEe

Execution of a DSB:

- At EL2 ensures that any memory accesses caused by speculative translation table walks from the Non-secure EL1&0 translation regime have been observed.
- At EL3 ensures that any memory accesses caused by speculative translation table walks from any of the following translation regimes have been observed:
  - The EL2 translation regime.
  - The Secure EL1&0 translation regime.
  - The Non-secure EL1&0 translation regime.

For more information, see *Use of out-of-context translation regimes* on page D4-1754.

A DSB completes when all of the following apply:

- All explicit memory accesses that are observed by PEe before the DSB is executed and are of the required access types, and are from observers in the same required shareability domain as PEe, are complete for the set of observers in the required shareability domain.
- If the required access types of the DSB is reads and writes, then all cache maintenance instructions and all TLB maintenance instructions issued by PEe before the DSB are complete for the required shareability domain.

In addition, no instruction that appears in program order after the DSB instruction can execute until the DSB completes.

The pseudocode function for the operation of a DSB is `DataSynchronizationBarrier()`.

See also *Memory barriers* on page D3-1738.

### Shareability and access limitations on the data barrier operations

The DMB and DSB instructions take an argument that specifies:

- The shareability domain over which the instruction must operate. This is one of:
  - Full system.
  - Outer Shareable.
  - Inner Shareable.
  - Non-shareable.
- The accesses for which the instruction operates. This is one of:
  - Read and write accesses in Group A and Group B.
  - Write accesses only in Group A and Group B.
  - Read access only in Group A and read and write accesses in Group B.

**Note**

This form of a DMB or DSB instruction can be described as a Load-Load/Store barrier.

Table B2-2 shows how these options are encoded in the <option> field of the instruction:

**Table B2-2 Encoding of the DMB and DSB <option> parameter**

| Accesses | | Shareability domain | | | |
|---|---|---|---|---|---|
| **Group A** | **Group B** | **Full system** | **Outer Shareable** | **Inner Shareable** | **Non-shareable** |
| Reads and writes | Reads and writes | SY | OSH | ISH | NSH |
| Writes | Writes | ST | OSHST | ISHST | NSHST |
| Reads | Reads and writes | LD | OSHLD | ISHLD | NSHLD |

See the instruction descriptions for more information:

- *DMB* on page C6-515.
- *DSB* on page C6-518.

**Note**

ISB also supports an optional limitation argument that can only contain one value that corresponds to full system operation, see *ISB* on page C6-534.

### Load-Acquire, Store-Release

ARMv8 provides a set of instructions with Acquire semantics for loads, and Release semantics for stores. See *Load-Acquire/Store-Release* on page C3-147.

For all memory types, these instructions have the following ordering requirements:

- A Store-Release followed by a Load-Acquire is observed in program order by any observers that are in both:
  - The shareability domain of the address accessed by the Store-Release.
  - The shareability domain of the address accessed by the Load-Acquire.
- For a Load-Acquire, observers in the shareability domain of the address accessed by the Load-Acquire observe accesses in the following order:
  1. The read caused by the Load-Acquire.
  2. Reads and writes caused by loads and stores that appear in program order after the Load-Acquire for which the shareability of the address accessed by the load or store requires that the observer observes the access.

  There are no additional ordering requirements on loads or stores that appear before the Load-Acquire.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- For a Store-Release, observers in the shareability domain of the address accessed by the Store-Release observe accesses in the following order:
  1. All of the following for which the shareability of the address accessed requires that the observer observes the access:
     - Reads and writes caused by loads and stores that appear in program order before the Store-Release.
     - Writes that were observed by the PE executing the Store-Release before it executed the Store-Release.
  2. The write caused by the Store-Release.

  There are no other ordering requirements on loads or stores that appear in program order after the Store-Release.
- A Store-Release instruction is multi-copy atomic when observed with a Load-Acquire instruction.

In addition, for accesses to a memory-mapped peripheral of an arbitrary system-defined size that are defined as any type of Device memory accesses, these instructions have the following requirements:

- A Load-Acquire to an address in the memory-mapped peripheral will ensure that all memory accesses using Device memory types to the same memory-mapped peripheral that are architecturally required to be observed after the Load-Acquire will arrive at the memory-mapped peripheral after the memory access of the Load-Acquire.
- A Store-Release to an address in the memory-mapped peripheral will ensure that all memory accesses using Device memory types to the same memory-mapped peripheral that are architecturally required to be observed before the Store-Release will arrive at the memory-mapped peripheral before the memory access of the Store-Release.
- If a Load-Acquire to a memory address in the memory-mapped peripheral has observed the value stored to that address by a Store-Release, then any memory access to the memory-mapped peripheral that is architecturally required to be ordered before the memory access of the Store-Release will arrive at the memory-mapped peripheral before any memory access to the same peripheral that is architecturally required to be ordered after the memory access of the Load-Acquire.

Load-Acquire and Store-Release, other than Load-Acquire Exclusive Pair and Store-Release-Exclusive Pair, access only a single data element. This access is single-copy atomic. The address of the data object must be aligned to the size of the data element being accessed, otherwise the access generates an Alignment fault.

Load-Acquire Exclusive Pair and Store-Release Exclusive Pair access two data elements. The address supplied to the instructions must be aligned to twice the size of the element being loaded, otherwise the access generates an Alignment fault.

A Store-Release Exclusive instruction only has the release semantics if the store is successful.

**Note**

- Each Load-Acquire Exclusive and Store-Release Exclusive instruction is essentially a variant of the equivalent Load-Exclusive or Store-Exclusive instruction. All usage restrictions and single-copy atomicity properties:
  - That apply to the Load-Exclusive instructions also apply to the Load-Acquire Exclusive instructions.
  - That apply to the Store-Exclusive instructions also apply to the Store-Release Exclusive instructions.
- The Load-Acquire/Store-Release instructions can remove the requirement to use the explicit DMB memory barrier instruction.

### B2.7.4 Summary of the memory ordering rules

The following is a concise list of the situations that are required, by the ARM architecture specification, to cause externally-visible order of memory. This ordering means that if memory transaction A has externally visible order ahead of memory transaction B, then all observers within the shareability domains of A and B will observe A before B. See *Terms used in the summary of the memory ordering rules* for definitions of the terms used.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

This list applies to both AArch32 state and AArch64 state, and is consistent with the requirements of ARMv7.

1. `DMB` and `DSB` barrier instructions, and load acquire/store release instructions, create externally-visible order as defined by those instructions.
2. A True or False Address dependency from a Load to a Load or from a Load to a Store creates externally-visible order.
3. A True Control dependency from a Load to an `ISB` instruction creates externally-visible order between the load and any memory accesses after the `ISB` instruction.
4. A True Register data dependency from a Load to a Store creates externally-visible order.
5. A True Control dependency from a Load to a Store creates externally-visible order.
6. Memory is coherent within the shareability domain of a memory address, which means there is a total order of all writes to that address that all observers within that shareability domain will agree on.

   **Note**

   A consequence of this is that reads to the same address by the same PE are observed in order.

7. A Dependency from a Store to a Load through memory between different PEs creates externally-visible order but stores are not multi-copy atomic except where explicitly defined to be by the definition of the store.

   **Note**

   A consequence of the lack of multi-copy atomicity is that a Store to Load dependency through memory on the same PE does not create externally-visible order.

No other effects are required to create externally visible order in the ARM architecture.

### Terms used in the summary of the memory ordering rules

The summary uses the following terms:

**Register data dependency**

This is defined in *Address dependencies and order* on page B2-85.

**False Register data dependency**

A False Register data dependency is a Register data dependency where no register in the system holds a variable for which a change of the first data value causes a change of the second data value.

**True Register data dependency**

A True Register data dependency is a Register data dependency that is not a false Register data dependency.

**True Address dependency**

A True Address dependency between a load and a subsequent memory transaction exists where there is a True Register data dependency between the data value returned from the load and the address used by the subsequent memory transaction.

**False Address dependency**

A False Address dependency between a load and a subsequent memory transaction exists where there is a False Register data dependency between the data value returned from the load and the address used by the subsequent memory transaction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**True Control dependency**

A True Control dependency between a load and a subsequent instruction exists:

- Where there is a True Register data dependency between the data value returned from the load and data value used in the evaluation of a conditional branch and the subsequent instruction is only executed as a result of one of the possible outcomes of that conditional branch.
- Where there is a True Register data dependency between the data value returned from the load and the data value used in the evaluation of a subsequent instruction that is a conditional selection, move, or computation for which both:
  - The condition is determined by the returned data value.
  - No input data value for the selection, move, or computation has a register data dependency on the returned data value.

**Dependency from a Store to a Load through memory**

A Dependency from a Store to a Load through memory exists where the Store and Load are to the same physical address, and value returned by the Load is the value that was written by the Store, and could not be the value that was previously held at that memory address.

## B2.8 Memory types and attributes

In ARMv8 the ordering of accesses for addresses in memory, referred to as the memory order model, is defined by the memory attributes. The following sections describe this model:

- *Normal memory*.
- *Device memory* on page B2-98.
- *Memory access restrictions* on page B2-103.

### B2.8.1 Normal memory

The Normal memory type attribute applies to most memory in a system. It indicates that the hardware is permitted by the architecture to perform speculative data read accesses to these locations, regardless of the access permissions for these locations.

The Normal memory type has the following properties:

- A write to a memory location with the Normal attribute completes in finite time. This means that it is globally observed for the shareability domain of the memory location in finite time. For a Non-cacheable location, the location is observed by all observers in finite time.
- A completed write to a memory location with the Normal attribute is globally observed for the shareability domain of the memory location in finite time without the need for explicit cache maintenance instructions or barriers. For a Non-cacheable location, the completed write is globally observed for all observers in finite time without the need for explicit cache maintenance instructions or barriers.
- Writes to a memory location with the Normal memory attribute that are Non-cacheable must reach the endpoint for that location in the memory system in finite time.
- Unaligned memory accesses can access Normal memory if the system is configured to generate such accesses.
- There is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register Load/Store instructions. See *Multi-register loads and stores that access Normal memory* on page B2-98.

**Note**

- The Normal memory attribute is appropriate for locations of memory that are idempotent, meaning that they exhibit all of the following properties:
  - Read accesses can be repeated with no side-effects.
  - Repeated read accesses return the last value written to the resource being read.
  - Read accesses can fetch additional memory locations with no side-effects.
  - Write accesses can be repeated with no side-effects if the contents of the location accessed are unchanged between the repeated writes or as the result of an exception, as described in this section.
  - Unaligned accesses can be supported.
  - Accesses can be merged before accessing the target memory system.
- An instruction that generates a sequence of accesses as described in *Atomicity in the ARM architecture* on page B2-80 might be abandoned as a result of an exception being taken during the sequence of accesses. On return from the exception the instruction is restarted, and therefore one or more of the memory locations might be accessed multiple times. This can result in repeated write accesses to a location that has been changed between the write accesses.

The following sections describe the other attributes for Normal memory:

- *Shareable Normal memory* on page B2-94.
- *Non-shareable Normal memory* on page B2-95.
- *Write-Through Cacheable, Write-Back Cacheable and Non-cacheable Normal memory* on page B2-95.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

See also:

- *Multi-register loads and stores that access Normal memory* on page B2-98.
- *Atomicity in the ARM architecture* on page B2-80.
- *Memory barriers* on page B2-86. For accesses to Normal memory, a `DMB` instruction is required to ensure the required ordering.
- *Concurrent modification and execution of instructions* on page B2-82.

## Shareable Normal memory

A Normal memory location has a Shareability attribute that is one of:

- Inner Shareable, meaning it applies across the Inner Shareable shareability domain.
- Outer Shareable, meaning it applies across both the Inner Shareable and the Outer Shareable shareability domains.
- Non-shareable.

The shareability attributes define the data coherency requirements of the location, that hardware must enforce. They do not affect the coherency requirements of instruction fetches, see *Synchronization and coherency issues between data and instruction accesses* on page B2-73.

**Note**

- System designers can use the shareability attribute to specify the locations in Normal memory for which coherency must be maintained. However, software developers must not assume that specifying a memory location as Non-shareable permits software to make assumptions about the incoherency of the location between different PEs in a shared memory system. Such assumptions are not portable between different multiprocessing implementations that might use the shareability attribute. Any multiprocessing implementation might implement caches that are shared, inherently, between different processing elements.
- This architecture assumes that all PEs that use the same operating system or hypervisor are in the same Inner Shareable shareability domain.

### *Shareable, Inner Shareable, and Outer Shareable Normal memory*

The ARM architecture abstracts the system as a series of Inner and Outer Shareability domains.

Each Inner Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Inner Shareable attribute made by any member of that set.

Each Outer Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Outer Shareable attribute made by any member of that set.

The following properties also hold:

- Each observer is only a member of a single Inner Shareability domain.
- Each observer is only a member of a single Outer Shareability domain.
- All observers in an Inner Shareability domain are always members of the same Outer Shareability domain. This means that an Inner Shareability domain is a subset of an Outer Shareability domain, although it is not required to be a proper subset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

- Because all data accesses to Non-cacheable locations are data coherent to all observers, Non-cacheable locations are always treated as Outer Shareable.
- The Inner Shareable domain is expected to be the set of PEs controlled by a single hypervisor or operating system.

The details of the use of the shareability attributes are system-specific. Example B2-1 shows how they might be used.

**Example B2-1 Use of shareability attributes**

In an implementation, a particular subsystem with two clusters of PEs has the requirement that:

- In each cluster, the data caches or unified caches of the PEs in the cluster are transparent for all data accesses to memory locations with the Inner Shareable attribute.
- However, between the two clusters, the caches:
  - Are not required to be coherent for data accesses that have only the Inner Shareable attribute.
  - Are coherent for data accesses that have the Outer Shareable attribute.

In this system, each cluster is in a different shareability domain for the Inner Shareable attribute, but all components of the subsystem are in the same shareability domain for the Outer Shareable attribute.

A system might implement two such subsystems. If the data caches or unified caches of one subsystem are not transparent to the accesses from the other subsystem, this system has two Outer Shareable shareability domains.

Having two levels of shareability means system designers can reduce the performance and power overhead for shared memory locations that do not need to be part of the Outer Shareable shareability domain.

For shareable Normal memory, the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer in the same Shareability domain.

### Non-shareable Normal memory

For Normal memory locations, the Non-shareable attribute identifies Normal memory that is likely to be accessed only by a single PE.

A location in Normal memory with the Non-shareable attribute does not require the hardware to make data accesses by different observers coherent, unless the memory is Non-cacheable. For a Non-shareable location, if other observers share the memory system, software must use cache maintenance instructions, if the presence of caches might lead to coherency issues when communicating between the observers. This cache maintenance requirement is in addition to the barrier operations that are required to ensure memory ordering.

For Non-shareable Normal memory, it is IMPLEMENTATION DEFINED whether the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer.

### Write-Through Cacheable, Write-Back Cacheable and Non-cacheable Normal memory

In addition to being Outer Shareable, Inner Shareable or Non-shareable, each region of Normal memory is assigned a cacheability attribute that is one of:

- Write-Through Cacheable.
- Write-Back Cacheable.
- Non-cacheable.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Also, for cacheable Normal memory regions:

- A region might be assigned a cache allocation hint.
- It is IMPLEMENTATION DEFINED whether the Write-Through Cacheable and Write-Back Cacheable attributes can have an additional attribute of Transient or Non-transient, see *Transient cacheability attribute* on page B2-97.

A memory location can be marked as having different cacheability attributes, for example when using aliases in a virtual to physical address mapping:

- If the attributes differ only in the cache allocation hint this does not affect the behavior of accesses to that location.
- For other cases see *Mismatched memory attributes* on page B2-104.

The cacheability attributes provide a mechanism of coherency control with observers that lie outside the shareability domain of a region of memory. In some cases, the use of Write-Through Cacheable or Non-cacheable regions of memory might provide a better mechanism for controlling coherency than the use of hardware coherency mechanisms or the use of cache maintenance routines. To this end, the architecture requires the following properties for Non-cacheable or Write-Through Cacheable memory:

- A completed write to a memory location that is Non-cacheable or Write-Through Cacheable for a level of cache made by an observer accessing the memory system inside the level of cache is visible to all observers accessing the memory system outside the level of cache without the need of explicit cache maintenance.
- A completed write to a memory location that is Non-cacheable for a level of cache made by an observer accessing the memory system outside the level of cache is visible to all observers accessing the memory system inside the level of cache without the need of explicit cache maintenance.
- For accesses to Normal memory that is Non-cacheable, a `DMB` instruction ensures that all members of Group A reach a single peripheral or block of memory, of IMPLEMENTATION DEFINED size, before any member of Group B, where:
  - The definition of the operation of a `DMB` instruction defines Group A and Group B, see *Data Memory Barrier (DMB)* on page B2-87.
  - The IMPLEMENTATION DEFINED size of the single peripheral or block of memory is defined by the peripheral or block of memory.

  This applies for all types of `DMB` instruction.

**Note**

Implementations can use the cache allocation hints to indicate a probable performance benefit of caching. For example, a programmer might know that a piece of memory is not going to be accessed again and would be better treated as Non-cacheable. The distinction between memory regions with attributes that differ only in the cache allocation hints exists only as a hint for performance.

For Normal memory, the ARM architecture provides cacheability attributes that are defined independently for each of two conceptual levels of cache, the *inner* and the *outer* cache. The relationship between these conceptual levels of cache and the implemented physical levels of cache is IMPLEMENTATION DEFINED, and can differ from the boundaries between the Inner and Outer Shareability domains. However:

- Inner refers to the innermost caches, meaning the caches that are closest to the PE, and always includes the lowest level of cache.
- No cache that is controlled by the Inner cacheability attributes can lie outside a cache that is controlled by the Outer cacheability attributes.
- An implementation might not have any outer cache.

Example B2-2 on page B2-97, Example B2-3 on page B2-97, and Example B2-4 on page B2-97 describe the possible ways of implementing a system with three levels of cache, *level 1* (L1) to *level 3* (L3).

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

- L1 cache is the level closest to the PE, see *Memory hierarchy* on page B2-70.
- When managing coherency, system designs must consider both the inner and outer cacheability attributes, as well as the shareability attributes. This is because hardware might have to manage the coherency of caches at one conceptual level, even when another conceptual level has the Non-cacheable attribute.

**Example B2-2 Implementation with two inner and one outer cache levels**

Implement the three levels of cache in the system, L1 to L3, with:

- The Inner cacheability attribute applied to L1 and L2 cache.
- The Outer cacheability attribute applied to L3 cache.

**Example B2-3 Implementation with three inner and no outer cache levels**

Implement the three levels of cache in the system, L1 to L3, with the Inner cacheability attribute applied to L1, L2, and L3 cache. Do not use the Outer cacheability attribute.

**Example B2-4 Implementation with one inner and two outer cache levels**

Implement the three levels of cache in the system, L1 to L3, with:

- The Inner cacheability attribute applied to L1 cache.
- The Outer cacheability attribute applied to L2 and L3 cache.

### *Transient cacheability attribute*

In ARMv8, it is IMPLEMENTATION DEFINED whether a Transient attribute is supported for cacheable Normal memory regions. If an implementation supports this attribute, the set of possible cacheability attributes for a Normal memory region becomes:

- Write-Through Cacheable, Non-transient.
- Write-Back Cacheable, Non-transient.
- Write-Through Cacheable, Transient.
- Write-Back Cacheable, Transient.
- Non-cacheable.

The cacheability attribute can be defined independently for the inner and outer levels of caching.

The transient attribute indicates that the benefit of caching is for a relatively short period. Therefore it might be better to restrict allocation of transient entries, to avoid possibly casting-out other, less transient, entries.

**Note**

The architecture does not specify what is meant by a *relatively short period*.

The description of the AArch64 MAIR_EL1, MAIR_EL2, and MAIR_EL3 registers, and the AArch32 MAIR0, MAIR1, HMAIR0, and HMAIR1 registers, includes the assignment of the Transient attribute in an implementation that supports this option.

Non-Confidential - Beta

### Multi-register loads and stores that access Normal memory

For all instructions that load or store more than one general-purpose register from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load or store instructions.

For all instructions that load or store more than one general-purpose register from an Exception level the order in which the registers are accessed is not defined by the architecture.

For all instructions that load or store one or more SIMD and floating-point register from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load or store instructions.

## B2.8.2 Device memory

The Device memory type attributes define memory locations where an access to the location can cause side-effects, or where the value returned for a load can vary depending on the number of loads performed. Typically, the Device memory attributes are used for memory-mapped peripherals and similar locations.

The attributes for ARMv8 Device memory are:

**Gathering** Identified as G or nG, see *Gathering* on page B2-100.

**Reordering** Identified as R or nR, see *Reordering* on page B2-101.

**Early Write Acknowledgement hint**

Identified as E or nE, see *Early Write Acknowledgement* on page B2-102.

The ARMv8 Device memory types are:

**Device-nGnRnE** Device non-Gathering, non-Reordering, No Early write acknowledgement.

Equivalent to the Strongly-ordered memory type in earlier versions of the architecture.

**Device-nGnRE** Device non-Gathering, non-Reordering, Early Write Acknowledgement.

Equivalent to the Device memory type in earlier versions of the architecture.

**Device-nGRE** Device non-Gathering, Reordering, Early Write Acknowledgement.

ARMv8 adds this memory type to the translation table formats found in earlier versions of the architecture. The use of barriers is required to order accesses to Device-nGRE memory.

**Device-GRE** Device Gathering, Reordering, Early Write Acknowledgement.

ARMv8 adds this memory type to the translation table formats found in earlier versions of the architecture. Device-GRE memory has the fewest constraints. It behaves similar to Normal memory, with the restriction that speculative accesses to Device-GRE memory is forbidden.

Collectively these are referred to as *any Device memory type*. Going down the list, the memory types are described as getting *weaker*; conversely the going up the list the memory types are described as getting *stronger*.

**Note**

- As the list of types shows, these additional attributes are hierarchical. For example, a memory location that permits Gathering must also permit Reordering and Early Write Acknowledgement.
- The architecture does not require an implementation to distinguish between each of these memory types and ARM recognizes that not all implementations will do so. The subsection that describes each of the attributes, describes the implementation rules for the attribute.
- Earlier versions of the ARM architecture defined the following memory types:
  - Strongly-ordered memory. This is the equivalent of the Device-nGnRnE memory type.
  - Device memory. This is the equivalent of the Device-nGnRE memory type.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

All of these memory types have the following properties:

- Speculative data accesses are not permitted to any memory location with any Device memory attribute. This means that each memory access to any Device memory type must be one that would be generated by a simple sequential execution of the program.

  The following exceptions to this apply:

  — Reads generated by the SIMD and floating-point instructions can access bytes that are not explicitly accessed by the instruction if the bytes accessed are in a 16-byte window, aligned to 16-bytes, that contains at least one byte that is explicitly accessed by the instruction.

  — For Device memory with the Gathering attribute, reads generated by the `LDNP` instructions are permitted to access bytes that are not explicitly accessed by the instruction, provided that the bytes accessed are in a 128-byte window, aligned to 128-bytes, that contains at least one byte that is explicitly accessed by the instruction.

  — Where a load or store instruction performs a sequence of memory accesses, as opposed to one single-copy atomic access as defined in the rules for single-copy atomicity, these accesses might occur multiple times as a result of executing the load or store instruction. See *Properties of single-copy atomic accesses* on page B2-81.

  **Note**

  — An instruction that generates a sequence of accesses as described in *Atomicity in the ARM architecture* on page B2-80 might be abandoned as a result of an exception being taken during the sequence of accesses. On return from the exception the instruction is restarted, and therefore one or more of the memory locations might be accessed multiple times. This can result in repeated accesses to a location where the program only defines a single access. For this reason, ARM strongly recommends that no accesses to Device memory are performed from a single instruction that spans the boundary of a translation granule or which in some other way could lead to some of the accesses being aborted.

  — Write speculation that is visible to other observers is prohibited for all memory types.

- A write to a memory location with any Device memory attribute completes in finite time. This means that it is globally observed for all observers in the system in finite time.

- If a location with any Device memory attribute changes without an explicit write by an observer, this change must also be globally observed for all observers in the system in finite time. Such a change might occur in a peripheral location that holds status information.

- A completed write to a memory location with any Device memory attribute is globally observed for all observers in finite time without the need for explicit maintenance.

- Data accesses to memory locations are coherent for all observers in the system, and correspondingly are treated as being Outer Shareable.

- A memory location with any Device memory attribute cannot be allocated into a cache.

- Writes to a memory location with any Device memory attribute must reach the endpoint for that address in the memory system in finite time. Typically, the endpoint is a peripheral or some physical memory.

- For accesses to any Device memory type, a `DMB` instruction ensures that all members of Group A reach a single peripheral or block of memory, of IMPLEMENTATION DEFINED size, before any member of Group B, where:

  — The definition of the operation of a `DMB` instruction defines Group A and Group B, see *Data Memory Barrier (DMB)* on page B2-87.

  — The IMPLEMENTATION DEFINED size of the single peripheral or block of memory is defined by the peripheral or block of memory.

  This applies for all types of `DMB` instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- All accesses to memory with any Device memory attribute must be aligned. Any unaligned access generates an Alignment fault at the first stage of translation that defined the location as being Device.

  **Note**

  In the Non-secure EL1&0 translation regime in systems where HCR_EL2.TGE==1 and HCR_EL2.DC==0, any Alignment fault that results from the fact that all locations are treated as Device is a fault at the first stage of translation. This causes ESR_EL2.ISS[24] to be 0.

- Hardware does not prevent speculative instruction fetches from a memory location with any of the Device memory attributes unless the memory location is also marked as Execute-never for all Exception levels.

  **Note**

  This means that to prevent speculative instruction fetches from memory locations with Device memory attributes, any location that is assigned any Device memory type must also be marked as Execute-never for all Exception levels. Failure to mark a memory location with any Device memory attribute as Execute-never for all Exception levels is a programming error.

See also *Memory access restrictions* on page B2-103.

The memory types for Translation table walks cannot be defined as any Device memory type within the TCR_ELx. For the Non-secure EL1&0 translation regime, the memory accesses made during a stage 1 translation table walk are subject to a stage 2 translation, and as a result of this second stage of translation, the accesses from the first stage translation table walk might be made to memory locations with any Device memory type. These accesses might be made speculatively. When the value of the HCR_EL2.PTW bit is 1, a stage 2 permission fault is generated if a first stage translation table walk is made to any Device memory type.

**Note**

In general, making a translation table walk to any Device memory type is the result of a programming error.

For instruction fetches, if branches cause the program counter to point to an area of memory with the Device attribute which is not marked as Execute-never for the current Exception level, an implementation can either:

- Treat the instruction fetch as if it were to a memory location with the Normal Non-cacheable attribute.
- Take a Permission fault.

### Gathering

In the Device memory attribute:

**G** Indicates that the location has the Gathering attribute.

**nG** Indicates that the location does not have the Gathering attribute, meaning it is non-Gathering.

The Gathering attribute determines whether it is permissible for either:

- Multiple memory accesses of the same type, read or write, to the same memory location to be merged into a single transaction.
- Multiple memory accesses of the same type, read or write, to different memory locations to be merged into a single memory transaction on an interconnect.

**Note**

This also applies to writebacks from the cache, whether caused by a *Natural eviction* or as a result of a cache maintenance instruction.

For memory types with the Gathering attribute, either of these behaviors is permitted, provided that the ordering and coherency rules of the memory location are followed.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For memory types with the non-Gathering attribute, neither of these behaviors is permitted. As a result:

- The number of memory accesses that are made corresponds to the number that would be generated by a simple sequential execution of the program.
- All accesses occur at their programmed size, except that there is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register Load/Store instructions. See *Multi-register loads and stores that access Device memory* on page B2-103.

Gathering between memory accesses separated by a memory barrier that affects those memory accesses is not permitted. This applies if one memory access is in Group A and one memory access is in Group B. That is, gathering is not permitted between a memory access in Group A and a memory access in Group B if the two accesses are separated by a barrier that affects at least one of the accesses.

Gathering between two memory accesses generated by a Load-Acquire/Store-Release is not permitted.

A read from a memory location with the non-Gathering attribute cannot come from a cache or a buffer, but must come from the endpoint for that address in the memory system. Typically this is a peripheral or physical memory.

**Note**

- A read from a memory location with the Gathering attribute can come from intermediate buffering of a previous write, provided that:
  - The accesses are not separated by a `DMB` or `DSB` barrier that affects both of the accesses, for example if one access is in Group A and the other is in Group B.
  - The accesses are not separated by other ordering constructions that require that the accesses are in order. Such a construction might be a combination of Load-Acquire and Store-Release.
  - The accesses are not generated by a Store-Release instruction.
- The ARM architecture only defines programmer visible behavior. Therefore, gathering can be performed if a programmer cannot tell whether gathering has occurred.

An implementation is permitted to perform an access with the Gathering attribute in a manner consistent with the requirements specified by the Non-gathering attribute.

An implementation is not permitted to perform an access with the Non-gathering attribute in a manner consistent with the relaxations allowed by the Gathering attribute.

### Reordering

In the Device memory attribute:

**R** Indicates that the location has the Reordering attribute. Accesses to the location can be reordered within the same rules that apply to accesses to Normal Non-cacheable memory. All memory types with the Reordering attribute have the same ordering rules as accesses to Normal Non-cacheable memory, see *Memory ordering* on page B2-83.

**nR** Indicates that the location does not have the Reordering attribute, meaning it is non-Reordering.

**Note**

Some interconnect fabrics, such as PCIe, perform very limited re-ordering, which is not important for the software usage. It is outside the scope of the ARM architecture to prohibit the use of a Non-reordering memory type with these interconnects.

For all memory types with the non-Reordering attribute, the order of memory accesses arriving at a single peripheral of IMPLEMENTATION DEFINED size, as defined by the peripheral, must be the same order that occurs in a simple sequential execution of the program. That is, the accesses appear in program order. This ordering applies to all accesses using any of the memory types with the non-Reordering attribute. As a result, if there is a mixture of Device-nGnRE and Device-nGnRnE accesses to the same peripheral, these occur in program order. If the memory accesses are not to a peripheral, then this attribute imposes no restrictions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

- The IMPLEMENTATION DEFINED size of the single peripheral is the same as applies for the ordering guarantee provided by the DMB instruction.
- The ARM architecture only defines programmer visible behavior. Therefore, reordering can be performed if a programmer cannot tell whether reordering has occurred.

An implementation:

- Is permitted to perform an access with the Reordering attribute in a manner consistent with the requirements specified by the non-Reordering attribute.
- Is not permitted to perform an access with the non-Reordering attribute in a manner consistent with the relaxations allowed by the Reordering attribute.

The non-Reordering attribute does not require any additional ordering, other than that which applies to Normal memory, between:

- Accesses with the non-Reordering attribute and accesses with the Reordering attribute.
- Accesses with the non-Reordering attribute and accesses to Normal memory.
- Accesses with the non-Reordering attribute and accesses to different peripherals of IMPLEMENTATION DEFINED size.

The non-Reordering attribute has no effect on the ordering of cache maintenance instructions, even if the memory location specified in the instruction has the non-Reordering attribute.

### Early Write Acknowledgement

In the Device memory attribute:

**E** Indicates that the location has the Early Write Acknowledgement attribute.

**nE** Indicates that the location has the No Early Write Acknowledgement attribute.

Early Write Acknowledgement is a hint to the platform memory system. Assigning the No Early Write Acknowledgement attribute to a Device memory location recommends that only the endpoint of the write access returns a write acknowledgement of the access, and that no earlier point in the memory system returns a write acknowledge. This means that a DSB barrier, executed by the PE that performed the write to the No Early Write Acknowledgement location, completes only after the write has reached its endpoint in the memory system. Typically, this endpoint is a peripheral or physical memory.

When the Early Write Acknowledgement attribute is assigned to a Device memory location, there is no such recommendation for the handling of accesses to that location.

**Note**

- The Early Write Acknowledgement hint has no effect on the ordering rules. The purpose of signaling no Early Write Acknowledgement is to signal to the interconnect that the peripheral requires the ability to signal the acknowledgement. The No Write Acknowledgement signal also provides an additional semantic that can be interpreted by the driver that is accessing the peripheral.
- This attribute is treated as a hint, as the exact nature of the interconnects accessed by a PE is outside the scope of the ARM architecture definition, and not all interconnects provide a mechanism to ensure that a write has reached the physical endpoint of the memory system.
- ARM recommends that writes with the No Early Write Acknowledgement hint are used for PCIe configuration writes. However, the mechanisms by which PCIe configuration writes are identified are IMPLEMENTATION DEFINED.
- ARM strongly recommends that the Early Write Acknowledgement hint is not ignored by a PE, but is made available for use by the system.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Because the No Early Write Acknowledgement attribute is a hint:

- An implementation is permitted to perform an access with the Early Write Acknowledgement attribute in a manner consistent with the requirements specified by the No Early Write Acknowledgement attribute.
- An implementation is permitted to perform an access with the No Early Write Acknowledgement attribute in a manner consistent with the relaxations allowed by the Early Write Acknowledgement attribute.

### Multi-register loads and stores that access Device memory

For all instructions that load or store more than one general-purpose register from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load or store instructions.

For all instructions that load or store more than one general-purpose register from an Exception level the order in which the registers are accessed is not defined by the architecture. This applies even to accesses to any type of Device memory.

For all instructions that load or store one or more floating-point and SIMD register from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load or store instructions, even for access to any type of Device memory.

## B2.8.3 Memory access restrictions

The following restrictions apply to memory accesses:

- For accesses to any two bytes, *p* and *q*, that are generated by the same instruction:
  - The bytes *p* and *q* must have the same memory type and shareability attributes, otherwise the results are CONSTRAINED UNPREDICTABLE. For example, an `LD1`, `ST1`, or an unaligned load or store that spans the boundary between Normal memory and Device memory is CONSTRAINED UNPREDICTABLE.
  - Except for possible differences in the cache allocation hints, ARM deprecates having different cacheability attributes for bytes *p* and *q*.

  For the permitted CONSTRAINED UNPREDICTABLE behavior, see *Crossing a page boundary with different memory types or Shareability attributes* on page K1-5504.
- If the accesses of an instruction that causes multiple accesses to any type of Device memory cross an address boundary that corresponds to the smallest implemented translation granule then behavior is CONSTRAINED UNPREDICTABLE, and *Crossing a peripheral boundary with a Device access* on page K1-5505 describes the permitted behaviors. For this reason, it is important that an access to a volatile memory device is not made using a single instruction that crosses an address boundary of the size of the smallest implemented translation granule.

  **Note**

  — The boundary referred to is between two Device memory regions that are both of the size of the smallest implemented translation granule and aligned to the size of the smallest implemented translation granule.

  — This restriction means it is important that an access to a volatile memory device is not made using a single instruction that crosses an address boundary of the size of the smallest implemented translation granule.

  — ARM expects this restriction to constrain the placing of volatile memory devices in the system memory map, rather than expecting a compiler to be aware of the alignment of memory accesses.

## B2.9 Mismatched memory attributes

Memory attributes are controlled by privileged software. For more information, see Chapter D4 *The AArch64 Virtual Memory System Architecture*.

Physical memory locations are accessed with *mismatched attributes* if all accesses to the location do not use a common definition of all of the following attributes of that location:

- Memory type, Device or Normal.
- Shareability.
- Cacheability, for the same level of the inner or outer cache, but excluding any cache allocation hints.

Collectively these are referred to as memory attributes.

**Note**

The terms *location* and *memory location* refer to any byte within the current coherency granule and are used interchangeably.

When a memory location is accessed with mismatched attributes the only software visible effects are one or more of the following:

- Uniprocessor semantics for reads and writes to that memory location might be lost. This means:
  - A read of the memory location by one agent might not return the value most recently written to that memory location by the same agent.
  - Multiple writes to the memory location by one agent with different memory attributes might not be ordered in program order.
- There might be a loss of coherency when multiple agents attempt to access a memory location.
- There might be a loss of properties derived from the memory type, as described in later bullets in this section.
- If all Load-Exclusive/Store-Exclusive instructions executed across all threads to access a given memory location do not use consistent memory attributes, the exclusive monitor state becomes UNKNOWN.
- Bytes written without the Write-Back cacheable attribute within the same Write-Back granule as bytes written with the Write-Back cacheable attribute might have their values reverted to the old values as a result of cache Write-Back.

The loss of properties associated with mismatched memory type attributes refers only to the following properties of Device memory that are additional to the properties of Normal memory:

- Prohibition of speculative read accesses.
- Prohibition on Gathering.
- Prohibition on Re-ordering.

For the following situations, when a physical memory location is accessed with mismatched attributes, a more restrictive set of behaviors applies. The description of each situation also describes the behaviors that apply:

1. If the only memory type mismatch associated with a memory location across all users of the memory location is between different types of Device memory, then all accesses might take the properties of the weakest Device memory type.
2. Any agent that reads that memory location using the same common definition of the shareability and cacheability attributes is guaranteed to access it coherently, to the extent required by that common definition of the memory attributes, only if all of the following conditions are met:
   - All aliases to the memory location with write permission both use a common definition of the shareability and cacheability attributes for the memory location, and either:
     - Have the inner cacheability attribute the same as the outer cacheability attribute.
     - In the Non-secure EL1&0 translation regime, have HCR_EL2.MIOCNCE set to 0.
   - All aliases to a memory location use a definition of the shareability attributes that encompasses all the agents with permission to access the location.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

3. The possible software-visible effects caused by mismatched attributes for a memory location are defined more precisely if all of the mismatched attributes define the memory location as one of:
   - Any Device memory type.
   - Normal Inner Non-cacheable, Outer Non-cacheable memory.

   In these cases, the only permitted software-visible effects of the mismatched attributes are one or more of the following:
   - Possible loss of properties derived from the memory type when multiple agents attempt to access the memory location.
   - Possible reordering of memory transactions to the same memory location with different memory attributes, potentially leading to a loss of coherency or uniprocessor semantics. Any possible loss of coherency or uniprocessor semantics can be avoided by inserting `DMB` barrier instructions between accesses to the same memory location that might use different attributes.

Where there is a loss of the uniprocessor semantics, ordering, or coherency, the following approaches can be used:

1. If the mismatched attributes for a memory location all assign the same shareability attribute to the location, any loss of uniprocessor semantics, ordering, or coherency within a shareability domain can be avoided by use of software cache management. To do so, software must use the techniques that are required for the software management of the ordering or coherency of cacheable locations between agents in different shareability domains. This means:
   - Before writing to a location not using the Write-Back attribute, software must invalidate, or clean, a location from the caches if any agent might have written to the location with the Write-Back attribute. This avoids the possibility of overwriting the location with stale data.
   - After writing to a location with the Write-Back attribute, software must clean the location from the caches, to make the write visible to external memory.
   - Before reading the location with a cacheable attribute, software must invalidate the location from the caches, to ensure that any value held in the caches reflects the last value made visible in external memory.
   - Executing a `DMB` barrier instruction, with scope that applies to the common shareability of the accesses, between any accesses to the same memory location that use different attributes.

   In all cases:
   - Location refers to any byte within the current coherency granule.
   - A clean and invalidate instruction can be used instead of a clean instruction, or instead of an invalidate instruction.
   - In the sequences outlined in this section, all cache maintenance instructions and memory transactions must be completed, or ordered by the use of barrier operations, if they are not naturally ordered by the use of a common address, see *Ordering and completion of data and instruction cache instructions* on page D3-1722.

   **Note**

   With software management of coherency, race conditions can cause loss of data. A race condition occurs when different agents write simultaneously to bytes that are in the same location, and the invalidate, write, clean sequence of one agent overlaps with the equivalent sequence of another agent. A race condition also occurs if the first operation of either sequence is a clean, rather than an invalidate.

2. If the mismatched attributes for a location mean that multiple cacheable accesses to the location might be made with different shareability attributes, then uniprocessor semantics, ordering, and coherency are guaranteed only if:
   - Each PE that accesses the location with a cacheable attribute performs a clean and invalidate of the location before and after accessing that location.
   - A `DMB` barrier with scope that covers the full shareability of the accesses is placed between any accesses to the same memory location that use different attributes.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

The Note in rule 1 of this list, about possible race conditions, also applies to this rule.

In addition, if multiple agents attempt to use Load-Exclusive or Store-Exclusive instructions to access a location, and the accesses from the different agents have different memory attributes associated with the location, the exclusive monitor state becomes UNKNOWN.

ARM strongly recommends that software does not use mismatched attributes for aliases of the same location. An implementation might not optimize the performance of a system that uses mismatched aliases.

## B2.10 Synchronization and semaphores

ARMv8 provides non-blocking synchronization of shared memory, using *synchronization primitives*. The information in this section about memory accesses by synchronization primitives applies to accesses to both Normal memory and to any type of Device memory.

**Note**

Use of the ARMv8 synchronization primitives scales for multiprocessing system designs.

Table B2-3 shows the synchronization primitives and the associated `CLREX` instruction.

**Table B2-3 Synchronization primitives and associated instruction**

| Function | A64 instruction |
|---|---|
| Load-Exclusive | |
| Byte | `LDXRB`, `LDAXRB` |
| Halfword | `LDXRH`, `LDAXRH` |
| Register[a] | `LDXR`, `LDAXR` |
| Pair[a] | `LDXP`, `LDAXP` |
| Store-Exclusive | |
| Byte | `STXRB`, `STLXRB` |
| Halfword | `STXRH`, `STLXRH` |
| Register[a] | `STXR`, `STLXR` |
| Pair[a] | `STXP`, `STLXP` |
| Clear-Exclusive | `CLREX` |

a. The instruction operates on a doubleword if accessing an X register, or on a word if accessing a W register.

The model for the use of a Load-Exclusive/Store-Exclusive instruction pair accessing a non-aborting memory address *x* is:

- The Load-Exclusive instruction reads a value from memory address *x*.
- The corresponding Store-Exclusive instruction succeeds in writing back to memory address *x* only if no other observer, process, or thread has performed a more recent store to address *x*. The Store-Exclusive instruction returns a status bit that indicates whether the memory write succeeded.

A Load-Exclusive instruction marks a small block of memory for exclusive access. The size of the marked block is IMPLEMENTATION DEFINED, see *Marking and the size of the marked memory block* on page B2-113. A Store-Exclusive instruction to any address in the marked block clears the marking.

**Note**

In this section, the term PE includes any observer that can generate a Load-Exclusive or a Store-Exclusive instruction.

The following sections give more information:

- *Exclusive access instructions and Non-shareable memory locations* on page B2-108.
- *Exclusive access instructions and Shareable memory locations* on page B2-110.
- *Marking and the size of the marked memory block* on page B2-113.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- *Context switch support* on page B2-113.
- *Load-Exclusive and Store-Exclusive instruction usage restrictions* on page B2-114.
- *Use of WFE and SEV instructions by spin-locks* on page B2-116.

### B2.10.1 Exclusive access instructions and Non-shareable memory locations

For memory locations for which the shareability attribute is Non-shareable, the exclusive access instructions rely on a *local monitor* that marks any address from which the PE executes a Load-Exclusive instruction. Any non-aborted attempt by the same PE to use a Store-Exclusive instruction to modify any address is guaranteed to clear the marking.

A Load-Exclusive instruction performs a load from memory, and:

- The executing PE marks the physical memory address for exclusive access.
- The local monitor of the executing PE transitions to the Exclusive Access state.

A Store-Exclusive instruction performs a conditional store to memory that depends on the state of the local monitor:

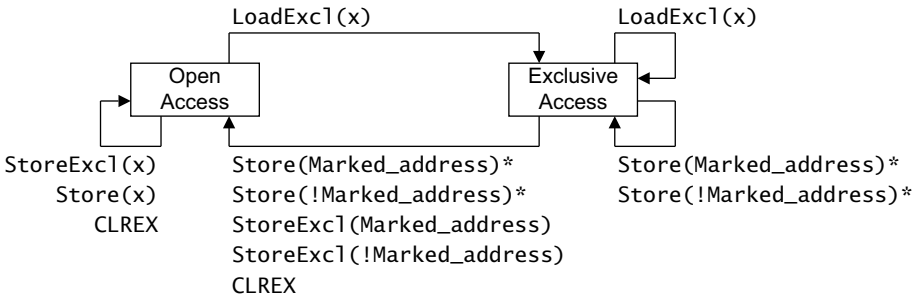
**If the local monitor is in the Exclusive Access state**

- If the address of the Store-Exclusive instruction is the same as the address that has been marked in the monitor by an earlier Load-Exclusive instruction, then the store occurs. Otherwise, it is IMPLEMENTATION DEFINED whether the store occurs.
- A status value is returned to a register:
  - If the store took place the status value is 0.
  - Otherwise, the status value is 1.
- The local monitor of the executing PE transitions to the Open Access state.

**If the local monitor is in the Open Access state**

- No store takes place.
- A status value of 1 is returned to a register.
- The local monitor remains in the Open Access state.

The Store-Exclusive instruction defines the register to which the status value is returned.



When a PE writes using any instruction other than a Store-Exclusive instruction:

- If the write is to a physical address that is not marked as Exclusive Access by its local monitor and that local monitor is in the Exclusive Access state it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.
- If the write is to a physical address that is marked as Exclusive Access by its local monitor it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.

It is IMPLEMENTATION DEFINED whether a store to a marked physical address causes a mark in the local monitor to be cleared if that store is by an observer other than the one that caused the physical address to be marked.

Figure B2-4 on page B2-109 shows the state machine for the local monitor and the effect of each of the operations shown in the figure.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Operations marked * are possible alternative IMPLEMENTATION DEFINED options.
In the diagram: `LoadExcl` represents any Load-Exclusive instruction
`StoreExcl` represents any Store-Exclusive instruction
`Store` represents any other store instruction.

Any `LoadExcl` operation updates the marked address to the most significant bits of the address x used for the operation.

**Figure B2-4 Local monitor state machine diagram**

For more information about marking see *Marking and the size of the marked memory block* on page B2-113.

**Note**

For the local monitor state machine, as shown in Figure B2-4:

- The IMPLEMENTATION DEFINED options for the local monitor are consistent with the local monitor being constructed so that it does not hold any physical address, but instead treats any access as matching the address of the previous Load-Exclusive instruction.
- A local monitor implementation can be unaware of Load-Exclusive and Store-Exclusive instructions from other PEs.
- The architecture does not require a load instruction by another PE, that is not a Load-Exclusive instruction, to have any effect on the local monitor.
- It is IMPLEMENTATION DEFINED whether the transition from Exclusive Access to Open Access state occurs when the `Store` or `StoreExcl` is from another observer.

## Changes to the local monitor state resulting from speculative execution

The architecture permits a local monitor to transition to the Open Access state as a result of speculation, or from some other cause. This is in addition to the transitions to Open Access state caused by the architectural execution of an operation shown in Figure B2-4.

An implementation must ensure that:

- The local monitor cannot be seen to transition to the Exclusive Access state except as a result of the architectural execution of one of the operations shown in Figure B2-4.
- Any transition of the local monitor to the Open Access state not caused by the architectural execution of an operation shown in Figure B2-4 must not indefinitely delay forward progress of execution.

Non-Confidential - Beta

### B2.10.2 Exclusive access instructions and Shareable memory locations

In the context of this section, a shareable memory location is a memory location that has, or is treated as if it has, a Shareability attribute of Inner Shareable or Outer Shareable.

For shareable memory locations, exclusive access instructions rely on:

- A *local monitor* for each PE in the system, that marks any address from which the PE executes a Load-Exclusive. The local monitor operates as described in *Exclusive access instructions and Non-shareable memory locations* on page B2-108, except that for shareable memory any Store-Exclusive is then subject to checking by the global monitor if it is described in that section as doing at least one of the following:
  - Updating memory.
  - Returning a status value of 0.

  The local monitor can ignore accesses from other PEs in the system.
- A *global monitor* that marks a physical address as exclusive access for a particular PE. This marking is used later to determine whether a Store-Exclusive to that address that has not been failed by the local monitor can occur. Any successful write to the marked block by any other observer in the shareability domain of the memory location is guaranteed to clear the marking. For each PE in the system, the global monitor:
  - Can hold at least one marked block.
  - Maintains a state machine for each marked block it can hold.

  **Note**

  For each PE, the architecture only requires global monitor support for a single marked address. Any situation that might benefit from the use of multiple marked addresses on a single PE is UNPREDICTABLE, see *Load-Exclusive and Store-Exclusive instruction usage restrictions* on page B2-114.

**Note**

The global monitor can either reside within the PE, or exist as a secondary monitor at the memory interfaces. The IMPLEMENTATION DEFINED aspects of the monitors mean that the global monitor and local monitor can be combined into a single unit, provided that the unit performs the global monitor and local monitor functions defined in this manual.

For shareable memory locations, in some implementations and for some memory types, the properties of the global monitor require functionality outside the PE. Some system implementations might not implement this functionality for all locations of memory. In particular, this can apply to:

- Any type of memory in the system implementation that does not support hardware cache coherency.
- Non-cacheable memory, or memory treated as Non-cacheable, in an implementation that does support hardware cache coherency.

In such a system, it is defined by the system:

- Whether the global monitor is implemented.
- If the global monitor is implemented, which address ranges or memory types it monitors.

**Note**

To support the use of the Load-Exclusive/Store-Exclusive mechanism when address translation is disabled, a system might define at least one location of memory, of at least the size of the translation granule, in the system memory map to support the global monitor for all ARM PEs within a common Inner Shareable domain. However, this is not an architectural requirement. Therefore, architecturally-compliant software that requires mutual exclusion must not rely on using the Load-Exclusive/Store-Exclusive mechanism, and must instead use a software algorithm such as Lamport's Bakery algorithm to achieve mutual exclusion.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Because implementations can choose which memory types are treated as Non-cacheable, the only memory types for which it is architecturally guaranteed that a global exclusive monitor is implemented are:

- Inner Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hints and Write allocation hints and not transient.
- Outer Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hints and Write allocation hints and not transient.

The set of memory types that support atomic instructions must include all of the memory types for which a global monitor is implemented.

If the global monitor is not implemented for an address range or memory type, then performing a Load-Exclusive or a Store-Exclusive instruction to such a location has one or more of the following effects:

- The instruction generates an external abort.
- The instruction generates an IMPLEMENTATION DEFINED MMU fault. This is reported using the Fault Status code of ESR_ELx.DFSC = `110101`.

  If the IMPLEMENTATION DEFINED MMU fault is generated for the Non-secure EL1&0 translation regime then:

  — If the fault is generated because of the memory type defined in the first stage of translation, or if the second stage of translation is disabled, then this is a first stage fault and the exception is taken to EL1.

  — Otherwise, the fault is a second stage fault and the exception is taken to EL2.

  The priority of this fault is IMPLEMENTATION DEFINED.
- The instruction is treated as a `NOP`.
- The Load-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN.
- The Store-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN. In this case, if the store exclusive instruction is a store exclusive pair of 64-bit quantities, then the two quantities being stored might not be stored atomically.
- The value held in the result register of the Store-Exclusive instruction becomes UNKNOWN.

In addition, for write transactions generated by non-PE observers that do not implement exclusive accesses or other atomic access mechanisms, the effect that writes have on the global and local monitors used by ARM PEs is IMPLEMENTATION DEFINED. The writes might not clear the global monitors of other PEs for:

- Some address ranges.
- Some memory types.

### Operation of the global monitor

A Load-Exclusive instruction from shareable memory performs a load from memory, and causes the physical address of the access to be marked as exclusive access for the requesting PE. This access can also cause the exclusive access mark to be removed from any other physical address that has been marked by the requesting PE.

**Note**

The global monitor only supports a single outstanding exclusive access to shareable memory per PE.

A Load-Exclusive instruction by one PE has no effect on the global monitor state for any other PE.

A Store-Exclusive instruction performs a conditional store to memory:

- The store is guaranteed to succeed only if the physical address accessed is marked as exclusive access for the requesting PE and both the local monitor and the global monitor state machines for the requesting PE are in the Exclusive Access state. In this case:

  — A status value of 0 is returned to a register to acknowledge the successful store.

  — The final state of the global monitor state machine for the requesting PE is IMPLEMENTATION DEFINED.

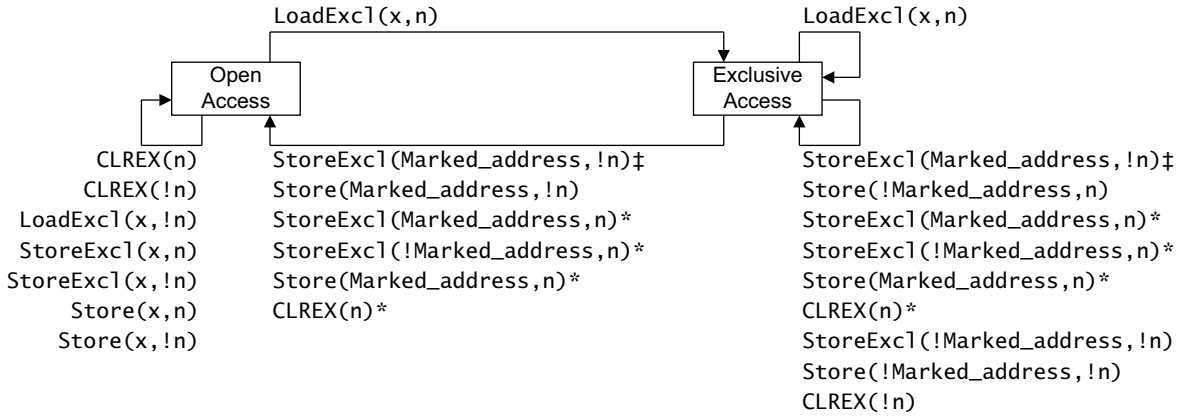
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

— If the address accessed is marked for exclusive access in the global monitor state machine for any other PE then that state machine transitions to Open Access state.

- If no address is marked as exclusive access for the requesting PE, the store does not succeed:
  — A status value of 1 is returned to a register to indicate that the store failed.
  — The global monitor is not affected and remains in Open Access state for the requesting PE.
- If a different physical address is marked as exclusive access for the requesting PE, it is IMPLEMENTATION DEFINED whether the store succeeds or not:
  — If the store succeeds a status value of 0 is returned to a register, otherwise a value of 1 is returned.
  — If the global monitor state machine for the PE was in the Exclusive Access state before the Store-Exclusive instruction it is IMPLEMENTATION DEFINED whether that state machine transitions to the Open Access state.

The Store-Exclusive instruction defines the register to which the status value is returned.

In a shared memory system, the global monitor implements a separate state machine for each PE in the system. The state machine for accesses to shareable memory by PE(n) can respond to all the shareable memory accesses visible to it. This means it responds to:



- Accesses generated by PE(n).
- Accesses generated by the other observers in the shareability domain of the memory location. These accesses are identified as (!n).

In a shared memory system, the global monitor implements a separate state machine for each observer that can generate a Load-Exclusive or a Store-Exclusive instruction in the system.

### *Clear global monitor event*

Whenever the global monitor state for a PE changes from Exclusive access to Open access, an event is generated and held in the Event register for that PE. This register is used by the Wait for Event mechanism, see *Mechanisms for entering a low-power state* on page D1-1611.

Figure B2-5 shows the state machine for PE(n) in a global monitor.

‡StoreExcl(Marked_address,!n) clears the monitor only if the StoreExcl updates memory
Operations marked * are possible alternative IMPLEMENTATION DEFINED options.
In the diagram: LoadExcl represents any Load-Exclusive instruction
StoreExcl represents any Store-Exclusive instruction
Store represents any other store instruction.

Any LoadExcl operation updates the marked address to the most significant bits of the address x used for the operation.

**Figure B2-5 Global monitor state machine diagram for PE(n) in a multiprocessor system**

For more information about marking see *Marking and the size of the marked memory block* on page B2-113.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

For the global monitor state machine, as shown in Figure B2-5 on page B2-112:

- The architecture does not require a load instruction by another PE, that is not a Load-Exclusive instruction, to have any effect on the global monitor.
- Whether a Store-Exclusive instruction successfully updates memory or not depends on whether the address accessed matches the marked shareable memory address for the PE issuing the Store-Exclusive instruction, and whether the local and global monitors are in the exclusive state. For this reason, Figure B2-5 on page B2-112 only shows how the operations by (!n) cause state transitions of the state machine for PE(n).
- A Load-Exclusive instruction can only update the marked shareable memory address for the PE issuing the Load-Exclusive instruction.
- When the global monitor is in the Exclusive Access state, it is IMPLEMENTATION DEFINED whether a `CLREX` instruction causes the global monitor to transition from Exclusive Access to Open Access state.
- It is IMPLEMENTATION DEFINED:
  - Whether a modification to a Non-shareable memory location can cause a global monitor to transition from Exclusive Access to Open Access state.
  - Whether a Load-Exclusive instruction to a Non-shareable memory location can cause a global monitor to transition from Open Access to Exclusive Access state.

### B2.10.3 Marking and the size of the marked memory block

When a Load-Exclusive instruction is executed, the resulting marked block ignores the least significant bits of the 64-bit memory address.

When a Load-Exclusive instruction is executed, a marked block of size $2^a$ bytes is created by ignoring the least significant bits of the memory address. A marked address is any address within this marked block. The size of the marked memory block is called the *Exclusives reservation granule*. The Exclusives reservation granule is IMPLEMENTATION DEFINED in the range 4 - 512 words.

**Note**

This definition means that the Exclusives reservation granule is:

- 4 words in an implementation where $a$ is 4.
- 512 words in an implementation where $a$ is 11.

For example, in an implementation where $a$ is 4, a successful `LDXRB` of address `0x341B4` defines a marked block using bits[47:4] of the address. This means that the four words of memory from `0x341B0` to `0x341BF` are marked for exclusive access.

In some implementations the CTR identifies the Exclusives reservation granule, see CTR_EL0. Otherwise, software must assume that the maximum Exclusives reservation granule, 512 words, is implemented.

### B2.10.4 Context switch support

An exception return clears the local monitor. As a result, performing a `CLREX` instruction as part of a context switch is not required in most situations.

**Note**

Context switching is not an application level operation. However, this information is included here to complete the description of the exclusive operations.

### B2.10.5 Load-Exclusive and Store-Exclusive instruction usage restrictions

The Load-Exclusive and Store-Exclusive instructions are intended to work together as a pair, for example a `LDXP`/`STXP` pair or a `LDXR`/`STXR` pair. To support different implementations of these functions, software must follow the notes and restrictions given here.

The following notes describe the use of a `LoadExcl`/`StoreExcl` pair, to indicate the use of any of the Load-Exclusive/Store-Exclusive pairs shown in Table B2-3 on page B2-107:

- The exclusives support a single outstanding exclusive access for each PE thread that is executed. The architecture makes use of this by not requiring an address or size check as part of the `IsExclusiveLocal()` function. If the target virtual address of a `StoreExcl` is different from the virtual address of the preceding `LoadExcl` instruction in the same thread of execution, behavior can be UNPREDICTABLE. As a result, a `LoadExcl`/`StoreExcl` pair can only be relied upon to eventually succeed if the `LoadExcl` and the `StoreExcl` are executed with the same virtual address.

- If two `StoreExcl` instructions are executed without an intervening `LoadExcl` instruction the second `StoreExcl` instruction returns a status value of 1. This means that:
  — ARM recommends that, in a given thread of execution, every `StoreExcl` instruction has a preceding `LoadExcl` instruction associated with it.

  It is not necessary for every `LoadExcl` instruction to have a subsequent `StoreExcl` instruction.

- An implementation of the Load-Exclusive and Store-Exclusive instructions can require that, in any thread of execution, the transaction size of a Store-Exclusive instruction is the same as the transaction size of the preceding Load-Exclusive instruction executed in that thread. If the transaction size of a Store-Exclusive instruction is different from the preceding Load-Exclusive instruction in the same thread of execution, behavior can be UNPREDICTABLE. As a result, software can rely on an `LoadExcl`/`StoreExcl` pair to eventually succeed only if they have the same size.

- An implementation of the Load-Exclusive and Store-Exclusive instructions can require that, in any thread of execution, the Store-Exclusive instruction accesses the same number of registers as the preceding Load-Exclusive instruction executed in that thread. If the Store-Exclusive instruction accesses a different number of registers than the preceding Load-Exclusive instruction in the same thread of execution, behavior is CONSTRAINED UNPREDICTABLE. As a result, software can rely on an `LoadExcl`/`StoreExcl` pair to eventually succeed only if they access the same number of registers. For more information see *UNPREDICTABLE behavior when Load-Exclusive/Store-Exclusive access a different number of registers* on page B2-115.

- An implementation might clear an exclusive monitor between the `LoadExcl` instruction and the `StoreExcl`, instruction without any application-related cause. For example, this might happen because of cache evictions. Software must, in any single thread of execution, avoid having any explicit memory accesses, System register updates, or cache maintenance instructions between the `LoadExcl` instruction and the associated `StoreExcl` instruction.

- Implementations can benefit from keeping the `LoadExcl` and `StoreExcl` operations close together in a single thread of execution. This minimizes the likelihood of the exclusive monitor state being cleared between the `LoadExcl` instruction and the `StoreExcl` instruction. Therefore, for best performance, ARM strongly recommends a limit of 128 bytes between `LoadExcl` and `StoreExcl` instructions in a single thread of execution.

- The architecture sets an upper limit of 2048 bytes on the exclusive reservation granule that can be marked as exclusive. For performance reasons, ARM recommends that objects that are accessed by exclusive accesses are separated by the size of the exclusive reservations granule. This is a performance guideline rather than a functional requirement.

- After taking a Data Abort exception, the state of the exclusive monitors is UNKNOWN.

- For the memory location accessed by a `LoadExcl`/`StoreExcl` pair, if the memory attributes for the `LoadExcl` instruction differ from the memory attributes for the `StoreExcl` instruction, behavior is UNPREDICTABLE.

  This can occur either:

  — Because the translation of the accessed address changes between the `LoadExcl` instruction and the `StoreExcl` instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

— As a result of using different virtual addresses, with different attributes, that point to the same physical address. This case is covered by another bullet point in this list.

- The effect of a data or unified cache invalidate, clean, or clean and invalidate instruction on a local or global exclusive monitor that is in the Exclusive Access state is UNPREDICTABLE. The instruction might clear the monitor, or it might leave it in the Exclusive Access state. For address-based maintenance instructions, this also applies to the monitors of other PEs in the same shareability domain as the PE executing the cache maintenance instruction, as determined by the shareability domain of the address being maintained.

  **Note**

  ARM strongly recommends that implementations ensure that the use of such maintenance instructions by a PE in the Non-secure state cannot cause a denial of service on a PE in the Secure state.

- If the mapping of the virtual to physical address is changed between the `LDREX` instruction and the `STREX` instruction, and the change is performed using a break-before-make sequence as described in *Using break-before-make when updating translation table entries* on page D4-1838, if the `STREX` is performed after another write to the same physical address as the `STREX`, and that other write was performed after the old translation was properly invalidated and that invalidation was properly synchronized, then the `STREX` will not pass its monitor check.

  **Note**

  ARM expects that, in many implementations, either:

  — The TLB invalidation will clear either the local or global monitor.

  — The physical address will be checked between the `LDREX` and `STREX`.

**Note**

In the event of repeatedly-contending Load-Exclusive/Store-Exclusive instruction sequences from multiple PEs, an implementation must ensure that forward progress is made by at least one PE.

### UNPREDICTABLE behavior when Load-Exclusive/Store-Exclusive access a different number of registers

As stated in this section, an implementation can require that the instructions of a Load-Exclusive/Store-Exclusive pair access the same number of registers. In such an implementation, this means behavior is CONSTRAINED UNPREDICTABLE if, in a single thread of execution, either:

- An `LDXP` instruction of two 32-bit quantities is followed by an `STXR` instruction of one 64-bit quantity at the same address.
- An `LDXR` instruction of one 64-bit quantity is followed by an `STXP` instruction of two 32-bit quantities at the same address.

In these cases, the CONSTRAINED UNPREDICTABLE behavior must be one of:

- The `STXP` or `STXR` instruction generates an external Data Abort.
- The `STXP` or `STXR` instruction generates an IMPLEMENTATION DEFINED MMU fault reported using the Fault Status code of ESR_ELx.DFSC = `0b110101`.
- The `STXP` or `STXR` instruction always fails, returning a status of 1.
- The `STXP` or `STXR` instruction always passes, returning a status of 0.
- This `STXP` or `STXR` instruction has the same pass or fail behavior that it would have had if the instruction had used the same size and number of registers as the preceding `LDXR` or `LDXP` instruction.

### B2.10.6 Use of WFE and SEV instructions by spin-locks

ARMv8 provides Wait For Event, Send Event, and Send Event Local instructions, `WFE`, `SEV`, and `SEVL`, that can assist with reducing power consumption and bus contention caused by PEs repeatedly attempting to obtain a spin-lock. These instructions can be used at the application level, but a complete understanding of what they do depends on a system level understanding of exceptions. They are described in *Wait for Event mechanism and Send event* on page D1-1611. However, in ARMv8, when the global monitor for a PE changes from Exclusive Access state to Open Access state, an event is generated.

**Note**

This is equivalent to issuing an `SEV` instruction on the PE for which the monitor state has changed. It removes the need for spinlock code to include an `SEV` instruction after clearing a spinlock.

# Part C
## The AArch64 Instruction Set

# Chapter C1
# The A64 Instruction Set

This chapter describes the A64 instruction set. It contains the following sections:

- *Introduction* on page C1-120.
- *Structure of the A64 assembler language* on page C1-121.
- *Address generation* on page C1-126.
- *Instruction aliases* on page C1-129.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## C1.1 Introduction

The instruction set supported in the AArch64 Execution state is known as A64.

All A64 instructions have a width of 32 bits. The A64 encoding structure breaks down into the following functional groups:

- A miscellaneous group of branch instructions, exception generating instructions, and system instructions.
- Data processing instructions associated with general-purpose registers. These instructions are supported by two *functional groups*, depending on whether the operands:
  - Are all held in registers.
  - Include an operand with a constant immediate value.
- Load and store instructions associated with the general-purpose register file and the SIMD and floating-point register file.
- SIMD and scalar floating-point data processing instructions that operate on the SIMD and floating-point registers.

The encoding hierarchy within a functional group breaks down as follows:

- A functional group consists of a set of related instruction classes. *A64 instruction index by encoding* on page C4-186 provides an overview of the instruction encodings in the form of a list of instruction classes within their functional groups.
- An instruction class consists of a set of related instruction forms. Instruction forms are documented in one of two alphabetic lists:
  - The load, store, and data processing instructions associated with the general-purpose registers, together with those in the other instruction classes. See Chapter C6 *A64 Base Instruction Descriptions*.
  - The load, store, and data processing instructions associated with the SIMD and floating-point support. See Chapter C7 *A64 Advanced SIMD and Floating-point Instruction Descriptions*.
- An instruction form might support a single instruction syntax. Where an instruction supports more than one syntax, each syntax is an *instruction variant*. Instruction variants can occur because of differences in:
  - The size or format of the operands.
  - The register file used for the operands.
  - The addressing mode used for load/load/store memory operands.

  Instruction variants might also arise as the result of other factors.

  Instruction variants are described in the instruction description for the individual instructions.

A64 instructions have a regular bit encoding structure:

- 5-bit register operand fields at fixed positions within the instruction. For general-purpose register operands, the values 0-30 select one of 31 registers. The value 31 is used as a special case that can:
  - Indicate use of the current stack pointer, when identifying a load/store base register or in a limited set of data processing instructions. See *The stack pointer registers* on page D1-1523.
  - Indicate the value zero when used as a source register operand.
  - Indicate discarding the result when used as a destination register operand.

  For SIMD and floating-point register access, the value used selects one of 32 registers.
- Immediate bits that provide constant data processing values or address offsets are placed in contiguous bitfields. Some computed values in instruction variants use one or more immediate bitfields together with the secondary encoding bitfields.

All encodings that are not fully defined are described as unallocated. An attempt to execute an unallocated instruction results in an Undefined Instruction exception, unless otherwise defined in the Exception model.

Non-Confidential - Beta

## C1.2 Structure of the A64 assembler language

The letter *W* denotes a general-purpose register holding a 32-bit word, and *X* denotes a general-purpose register holding a 64-bit doubleword.

An A64 assembler recognizes both upper-case and lower-case variants of the instruction mnemonics and register names, but not mixed case variants. An A64 disassembler can output either upper-case or lower-case mnemonics and register names. Program and data labels are case-sensitive.

The A64 assembly language does not require the # character to introduce constant immediate operands, but an assembler must allow immediate values introduced with or without the # character. ARM recommends that an A64 disassembler outputs a # before an immediate operand.

In Example C1-1 on page C1-122 the sequence // is used as a comment leader and A64 assemblers are encouraged to accept this syntax.

### C1.2.1 Common syntax terms

The following syntax terms are used frequently throughout the A64 instruction set description.

`UPPER` Text in upper-case letters is fixed. Text in lower-case letters is variable. This means that register name `Xn` indicates that the `X` is required, followed by a variable register number, for example `X29`.

`< >` Any text enclosed by angle braces, < >, is a value that the user supplies. Subsequent text might supply additional information.

`{ }` Any item enclosed by curly brackets, { }, is optional. A description of the item and how its presence or absence affects the instruction is normally supplied by subsequent text. In some cases curly braces are actual symbols in the syntax, for example when they surround a register list. These cases are called out in the surrounding text.

`[ ]` Any items enclosed by square brackets, [ ], constitute a list of alternative characters. A single one of the characters can be used in that position and the subsequent text describes the meaning of the alternatives. In some case the square brackets are part of the syntax itself, such as addressing modes or vector elements. These cases are called out in the surrounding text.

`a|b` Alternative words are separated by a vertical bar, |, and can be surrounded by parentheses to delimit them. For example, `U(ADD|SUB)W` represents `UADDW` or `USUBW`.

`±` This indicates an optional + or - sign. If neither is used then + is assumed.

`uimm`*n* An *n*-bit unsigned, positive, immediate value.

`simm`*n* An *n*-bit two's complement, signed immediate value, where *n* includes the sign bit.

`SP` See *Register names* on page C1-122.

`Wn` See *Register names* on page C1-122.

`WSP` See *Register names* on page C1-122.

`WZR` See *Register names* on page C1-122.

`Xn` See *Register names* on page C1-122.

`XZR` See *Register names* on page C1-122

### C1.2.2 Instruction Mnemonics

The A64 assembly language overloads instruction mnemonics and distinguishes between the different forms of an instruction based on the operand types. For example, the following `ADD` instructions all have different opcodes. However, the programmer must only remember one mnemonic, as the assembler automatically chooses the correct opcode based on the operands. The disassembler follows the same procedure in reverse.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Example C1-1 ADD instructions with different opcodes**

```
ADD W0, W1, W2              // add 32-bit register
ADD X0, X1, X2              // add 64-bit register
ADD X0, X1, W2, SXTW        // add 64-bit extended register
ADD X0, X1, #42             // add 64-bit immediate
```

### C1.2.3 Condition Code

The A64 ISA has some instructions that set condition flags or test condition codes or both. For information about instructions that set the condition flags or use the condition mnemonics, see *Condition flags and related instructions* on page C6-430.

Table C1-1 shows the available condition codes.

**Table C1-1 Condition codes**

| cond | Mnemonic | Meaning (integer) | Meaning (floating-point)[a] | Condition flags |
|---|---|---|---|---|
| 0000 | EQ | Equal | Equal | Z == 1 |
| 0001 | NE | Not equal | Not equal or unordered | Z == 0 |
| 0010 | CS or HS | Carry set | Greater than, equal, or unordered | C == 1 |
| 0011 | CC or LO | Carry clear | Less than | C == 0 |
| 0100 | MI | Minus, negative | Less than | N == 1 |
| 0101 | PL | Plus, positive or zero | Greater than, equal, or unordered | N == 0 |
| 0110 | VS | Overflow | Unordered | V == 1 |
| 0111 | VC | No overflow | Ordered | V == 0 |
| 1000 | HI | Unsigned higher | Greater than, or unordered | C ==1 && Z == 0 |
| 1001 | LS | Unsigned lower or same | Less than or equal | !(C ==1 && Z ==0) |
| 1010 | GE | Signed greater than or equal | Greater than or equal | N == V |
| 1011 | LT | Signed less than | Less than, or unordered | N! = V |
| 1100 | GT | Signed greater than | Greater than | Z == 0 && N == V |
| 1101 | LE | Signed less than or equal | Less than, equal, or unordered | !(Z == 0 && N == V) |
| 1110 | AL | Always | Always | Any |
| 1111 | NV[b] | Always | Always | Any |

a. Unordered means at least one NaN operand.

b. The condition code NV exists only to provide a valid disassembly of the 0b1111 encoding, otherwise its behavior is identical to AL.

### C1.2.4 Register names

This section describes the AArch64 registers. It contains the following subsections:

- *General-purpose register file and the stack pointer* on page C1-123.
- *SIMD and floating-point register file* on page C1-123.
- *SIMD and floating-point scalar register names* on page C1-124.
- *SIMD vector register names* on page C1-124.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- *SIMD vector element names* on page C1-124.

### General-purpose register file and the stack pointer

The 31 general-purpose registers in the general-purpose register file are named R0-R30 and encoded in the instruction register fields with values 0-30. A general-purpose register field that encodes the value 31 represents either the current stack pointer or the zero register, depending on the instruction and the operand position.

When the registers are used in a specific instruction variant, they must be qualified to indicate the operand data size, 32 bits or 64 bits, and the data size of the instruction.

When the data size is 32 bits, the lower 32 bits of the register are used and the upper 32 bits are ignored on a read and cleared to zero on a write.

Table C1-2 shows the qualified names for registers, where *n* is a register number 0-30.

**Table C1-2 General-purpose register names**

| Name | Size | Encoding | Description |
|---|---|---|---|
| Wn | 32 bits | 0-30 | General-purpose register 0-30 |
| Xn | 64 bits | 0-30 | General-purpose register 0-30 |
| WZR | 32 bits | 31 | Zero register |
| XZR | 64 bits | 31 | Zero register |
| WSP | 32 bits | 31 | Current stack pointer |
| SP | 64 bits | 31 | Current stack pointer |

The following list provides further details relating to Table C1-2.

- The names Xn and Wn both refer to the same general-purpose register, Rn.
- There is no register named W31 or X31.
- The name SP represents the stack pointer for 64-bit operands where an encoding of the value 31 in the corresponding register field is interpreted as a read or write of the current stack pointer. When instructions do not interpret this operand encoding as the stack pointer, use of the name SP is an error.
- The name WSP represents the current stack pointer in a 32-bit context.
- The name XZR represents the zero register for 64-bit operands where an encoding of the value 31 in the corresponding register field is interpreted as returning zero when read or discarding the result when written. When instructions do not interpret this operand encoding as the zero register, use of the name XZR is an error.
- The name WZR represents the zero register in a 32-bit context.
- The architecture does not define a specific name for general-purpose register R30 to reflect its role as the link register on procedure calls. However, an A64 assembler must always use W30 and X30 for this purpose, and additional software names might be defined as part of the Procedure Call Standard, see *Procedure Call Standard for the ARM 64-bit Architecture*.

### SIMD and floating-point register file

The 32 registers in the SIMD and floating-point register file, V0-V31, hold floating-point operands for the scalar floating-point instructions, and both scalar and vector operands for the SIMD instructions. When they are used in a specific instruction form, the names must be further qualified to indicate the data shape, that is the data element size and the number of elements or lanes within the register. A similar requirement is placed on the general-purpose registers. See *General-purpose register file and the stack pointer*.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

The data type is described by the instruction mnemonics that operate on the data. The data type is not described by the register name. The data type is the interpretation of bits within each register or vector element, whether these are integers, floating-point values, polynomials or cryptographic hashes.

### SIMD and floating-point scalar register names

SIMD and floating-point instructions that operate on scalar data only access the lower bits of a SIMD and floating-point register. The unused high bits are ignored on a read and cleared to 0 on a write.

Table C1-3 shows the qualified names for accessing scalar SIMD and floating-point registers. The letter *n* denotes a register number between 0 and 31.

**Table C1-3 SIMD and floating-point scalar register names**

| Size | Name |
|---|---|
| 8 bits | `Bn` |
| 16 bits | `Hn` |
| 32 bits | `Sn` |
| 64 bits | `Dn` |
| 128 bits | `Qn` |

### SIMD vector register names

If a register holds multiple data elements on which arithmetic is performed in a parallel, SIMD, manner, then a qualifier describes the vector shape. The vector shape is the element size and the number of elements or lanes. If the element size in bits multiplied by the number of lanes does not equal 128, then the upper 64 bits of the register are ignored on a read and cleared to zero on a write.

Table C1-4 shows the SIMD vector register names. The letter *n* denotes a register number between 0 and 31.

**Table C1-4 SIMD vector register names**

| Shape | Name |
|---|---|
| 8 bits × 8 lanes | `Vn.8B` |
| 8 bits × 16 lanes | `Vn.16B` |
| 16 bits × 4 lanes | `Vn.4H` |
| 16 bits × 8 lanes | `Vn.8H` |
| 32 bits × 2 lanes | `Vn.2S` |
| 32 bits × 4 lanes | `Vn.4S` |
| 64 bits × 1 lane | `Vn.1D` |
| 64 bits × 2 lanes | `Vn.2D` |

### SIMD vector element names

Appending a constant, zero-based element index to the register name inside square brackets indicates that a single element from a SIMD and floating-point register is used as a scalar operand. The number of lanes is not represented, as it is not encoded in the instruction and can only be inferred from the index value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Table C1-5 shows the vector register names and the element index. The letter *i* denotes the element index.

**Table C1-5 Vector register names with element index**

| Size | Name |
|---|---|
| 8 bits | `Vn.B[i]` |
| 16 bits | `Vn.H[i]` |
| 32 bits | `Vn.S[i]` |
| 64 bits | `Vn.D[i]` |

An assembler must accept a fully qualified SIMD register name, if the number of lanes is greater than the index value. See *SIMD vector register names* on page C1-124. For example, an assembler must accept all of the following forms as the name for the 32-bit element in bits [63:32] of the SIMD and floating-point register V9:

```
V9.S[1]     //standard disassembly
V9.2S[1]    //optional number of lanes
V9.4S[1]    //optional number of lanes
```

**Note**

The SIMD and floating-point register element name `Vn.S[0]` is not equivalent to the scalar SIMD and floating-point register name `Sn`. Although they represent the same bits in the register, they select different instruction encoding forms, either the vector element or the scalar form.

### *SIMD vector register list*

Where an instruction operates on multiple SIMD and floating-point registers, for example vector Load/Store structure and table lookup operations, the registers are specified as a list enclosed by curly braces. This list consists of either a sequence of registers separated by commas, or a register range separated by a hyphen. The registers must be numbered in increasing order, modulo 32, in increments of one. The hyphenated form is preferred for disassembly if there are more than two registers in the list and the register number are increasing. The following examples are equivalent representations of a set of four registers `V4` to `V7`, each holding four lanes of 32-bit elements:

```
{ V4.4S - V7.4S }              //standard disassembly
{ V4.4S, V5.4S, V6.4S, V7.4S } //alternative representation
```

### *SIMD vector element list*

Registers in a list can also have a vector element form. For example, the `LD4` instruction can load one element into each of four registers, and in this case the index is appended to the list as follows:

```
{ V4.S - V7.S }[3]                //standard disassembly
{ V4.4S, V5.4S, V6.4S, V7.4S }[3]  //alternative with optional number of lanes
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C1.3 Address generation

The A64 instruction set supports 64-bit addresses. The valid address range is determined by the following factors:

- The size of the implemented virtual address space.
- *Memory Management Unit* (MMU) configuration settings.

The top 8 bits of the 64-bit address can be used as a tag, see *Address tagging in AArch64 state* on page D4-1742. For more information on memory management and address translation, see Chapter D4 *The AArch64 Virtual Memory System Architecture*.

### C1.3.1 Register indexed addressing

The A64 instruction set allows a 64-bit index register to be added to the 64-bit base register, with optional scaling of the index by the access size. Additionally it allows for sign-extension or zero-extension of a 32-bit value within an index register, followed by optional scaling.

### C1.3.2 PC-relative addressing

The A64 instruction set has support for position-independent code and data addressing:

- PC-relative literal loads have an offset range of ± 1MB.
- Process state flag and compare based conditional branches have a range of ± 1MB. Test bit conditional branches have a restricted range of ± 32KB.
- Unconditional branches, including branch and link, have a range of ± 128MB.

PC-relative Load/Store operations, and address generation with a range of ± 4GB can be performed using two instructions.

### C1.3.3 Load/Store addressing modes

Load/Store addressing modes in the A64 instruction set require a 64-bit base address from a general-purpose register X0-X30 or the current stack pointer, `SP`, with an optional immediate or register offset. Table C1-6 shows the assembler syntax for the complete set of Load/Store addressing modes.

**Table C1-6 A64 Load/Store addressing modes**

| Addressing Mode | Offset | | |
|---|---|---|---|
| | Immediate | Register | Extended Register |
| Base register only (no offset) | `[base{, #0}]` | - | - |
| Base plus offset | `[base{, #imm}]` | `[base, Xm{, LSL #imm}]` | `[base, Wm, (S\|U)XTW {#imm}]` |
| Pre-indexed | `[base, #imm]!` | - | - |
| Post-indexed | `[base], #imm` | `[base], Xm`[a] | - |
| Literal (PC-relative) | `label` | - | - |

a. The post-indexed by register offset mode can be used with the SIMD Load/Store structure instructions described in *Load/Store Vector* on page C3-150. Otherwise the post-indexed by register offset mode is not available.

Some types of Load/Store instruction support only a subset of the Load/Store addressing modes listed in Table C1-6. Details of the supported modes are as follows:

- Base plus offset addressing means that the address is the value in the 64-bit base register plus an offset.
- Pre-indexed addressing means that the address is the sum of the value in the 64-bit base register and an offset, and the address is then written back to the base register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Post-indexed addressing means that the address is the value in the 64-bit base register, and the sum of the address and the offset is then written back to the base register.
- Literal addressing means that the address is the value of the 64-bit program counter for this instruction plus a 19-bit signed word offset. This means that it is a 4 byte aligned address within ±1MB of the address of this instruction with no offset. Literal addressing can only be used for loads of at least 32 bits and for prefetch instructions. The PC cannot be referenced using any other addressing modes. The syntax for labels is specific to individual toolchains.
- An immediate offset can be unsigned or signed, and scaled or unscaled, depending on the type of Load/Store instruction. When the immediate offset is scaled it is encoded as a multiple of the transfer size, although the assembly language always uses a byte offset, and the assembler or disassembler performs the necessary conversion. The usable byte offsets therefore depend on the type of Load/Store instruction and the transfer size.

  Table C1-7 shows the offset and the type of Load/Store instruction.

**Table C1-7 Immediate offsets and the type of Load/Store instruction**

| Offset bits | Sign | Scaling | Write-Back | Load/Store type |
|---|---|---|---|---|
| 0 | - | - | - | Exclusive/acquire/release |
| 7 | Signed | Scaled | Optional | Register pair |
| 9 | Signed | Unscaled | Optional | Single register |
| 12 | Unsigned | Scaled | No | Single register |

- A register offset means that the offset is the 64 bits from a general-purpose register, Xm, optionally scaled by the transfer size, in bytes, if `LSL #imm` is present and where `imm` must be equal to $\log_2$(transfer_size).
- An extended register offset means that offset is the bottom 32 bits from a general-purpose register Wm, sign-extended or zero-extended to 64 bits, and then scaled by the transfer size if so indicated by `#imm`, where imm must be equal to $\log_2$(transfer_size). An assembler must accept Wm or Xm as an extended register offset, but Wm is preferred for disassembly.
- Generating an address lower than the value in the base register requires a negative signed immediate offset or a register offset holding a negative value.
- When stack alignment checking is enabled by system software and the base register is the SP, the current stack pointer must be initially quadword aligned, that is aligned to 16 bytes. Misalignment generates a Stack Alignment fault. The offset does not have to be a multiple of 16 bytes unless the specific Load/Store instruction requires this. SP cannot be used as a register offset.

### Address calculation

General-purpose arithmetic instructions can calculate the result of most addressing modes and write the address to a general-purpose register or, in most cases, to the current stack pointer.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Table C1-8 shows the arithmetic instructions that can compute addressing modes.

**Table C1-8 Arithmetic instructions to compute addressing modes**

| Addressing Form | Offset | | |
|---|---|---|---|
| | Immediate | Register | Extended Register |
| Base register (no offset) | `MOV Xd\|SP, base` | - | - |
| Base plus offset | `ADD Xd\|SP, base, #imm`<br>or<br>`SUB Xd\|SP, base, #imm` | `ADD <Xd\|SP>, base, Xm{,LSL#imm}` | `ADD <Xd\|SP>, base, Wm,(S\|U)XT(W\|H\|B\|) {#imm}` |
| Pre-indexed | - | - | - |
| Post-indexed | - | - | - |
| Literal (PC-relative) | `ADR Xd, label` | - | - |

**Note**

- To calculate a base plus immediate offset the `ADD` instructions defined in *Arithmetic (immediate)* on page C3-153 accept an unsigned 12-bit immediate offset, with an optional left shift by 12. This means that a single `ADD` instruction cannot support the full range of byte offsets available to a single register Load/Store with a scaled 12-bit immediate offset. For example, a quadword `LDR` effectively has a 16-bit byte offset. To calculate an address with a byte offset that requires more than 12 bits it is necessary to use two `ADD` instructions. The following example shows this:

  ```
  ADD  Xd, base, #(imm & 0xFFF)
  ADD  Xd, Xd, #(imm>>12), LSL #12
  ```

- To calculate a base plus extended register offset, the `ADD` instructions defined in *Arithmetic (extended register)* on page C3-158 provide a superset of the addressing mode that also supports sign-extension or zero-extension of a byte or halfword value with any shift amount between 0 and 4, for example:

  ```
  ADD   Xd, base, Wm, SXTW #3    // Xd = base + (SignExtend(Wm) LSL 3)
  ADD   Xd, base, Wm, UXTH #4    // Xd = base + (ZeroExtend(Wm<15:0>) LSL 4)
  ```

- If the same extended register offset is used by more than one Load/Store instruction, then, depending on the implementation, it might be more efficient to calculate the extended and scaled intermediate result just once, and then re-use it as a simple register offset. The extend and scale calculation can be performed using the `SBFIZ` and `UBFIZ` bitfield instructions defined in *Bitfield move* on page C3-155, for example:

  ```
  SBFIZ Xd, Xm, #3, #32    //Xd = “Wm, SXTW #3”
  UBFIZ Xd, Xm, #4, #16    //Xd = “Wm, UXTH #4”
  ```

## C1.4 Instruction aliases

Some instructions have an associated *architecture alias* that is used for disassembly of the encoding when the associated conditions are met. Architecture alias instructions are included in the alphabetic lists of instruction types and clearly presented as an alias form in descriptions for the individual instructions.

# Chapter C2
# About the A64 Instruction Descriptions

This chapter describes the *instruction descriptions* contained in Chapter C6 *A64 Base Instruction Descriptions* and Chapter C7 *A64 Advanced SIMD and Floating-point Instruction Descriptions*.

It contains the following sections:

- *Understanding the A64 instruction descriptions* on page C2-132.
- *Conventions used in AArch64 instruction and System register descriptions* on page C2-135.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## C2.1 Understanding the A64 instruction descriptions

Each instruction description in Chapter C6 and Chapter C7 has the following content:

1. A title.
2. An introduction to the instruction.
3. The instruction encoding or encodings.
4. Any alias conditions.
5. A list of the assembler symbols for the instruction.
6. Pseudocode describing how the instruction operates.
7. Notes, if applicable.

The following sections describe each of these.

### C2.1.1 The title

The title of an instruction description includes the base mnemonic for the instruction.

If different forms of an instruction use the same base mnemonic, each form has its own description. In this case, the title is the mnemonic followed by a short description of the instruction form in parentheses. This is most often used when an operand is an immediate value in one instruction form, but is a register in another form.

For example, in Chapter C6 there are the following titles for different forms of the `ADD` instruction:

- *ADD (extended register)* on page C6-434.
- *ADD (immediate)* on page C6-437.
- *ADD (shifted register)* on page C6-439.

### C2.1.2 An introduction to the instruction

This briefly describes the function of the instruction. The introduction is not a complete description of the instruction, and it is not definitive. If there is any conflict between it and the more detailed information that follows it, the more detailed information takes priority.

### C2.1.3 The instruction encoding or encodings

This shows the instruction encoding diagram, or if the instruction has more than one encoding, shows all of the encoding diagrams. Each diagram has a subheading.

For example, for load and store instructions, the subheadings might be:

- Post-index.
- Pre-index.
- Unsigned offset.

Each diagram numbers the bits from 31 to 0. The diagram for an instruction at address *A* shows, from left to right, the bytes at addresses *A*+3, *A*+2, *A*+1, and *A*.

There might be variants of an encoding, if the *assembler syntax prototype* differs depending on the value in one or more of the encoding fields. In this case, each variant has a subheading that describes the variant and shows the distinguishing field value or values in parentheses. For example, in Chapter C6 there are the following subheadings for variants of the `ADC` instruction encoding:

- 32-bit variant (sf = 0).
- 64-bit variant (sf = 1).

The assembler syntax prototype for an encoding or variant of an encoding shows how to form a complete assembler source code instruction that assembles to the encoding. Unless otherwise stated, the prototype is also the preferred syntax for a disassembler to disassemble the encoding to. Disassemblers are permitted to omit optional symbols that represent the default value of a field or set of fields, to produce more readable disassembled code, provided that the output re-assembles to the same encoding.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Each encoding diagram, and its associated assembler syntax prototypes, is followed by encoding-specific pseudocode that translates the fields of that encoding into inputs for the encoding-independent pseudocode that describes the operation of the instruction. See *Pseudocode describing how the instruction operates* on page C2-134.

### C2.1.4 Any alias conditions, if applicable

This is an optional part of an instruction description. If included, it describes the set of conditions for which an alternative mnemonic and its associated assembler syntax prototypes are preferred for disassembly by a disassembler. It includes a link to the alias instruction description that defines the alternative syntax. The alias syntax and the original syntax can be used interchangeably in the assembler source code.

ARM recommends that if a disassembler outputs the alias syntax, it consistently outputs the alias syntax.

### C2.1.5 A list of the assembler symbols for the instruction

The *Assembler symbols* subsection of the instruction description contains a list of the symbols that the assembler syntax prototype or prototypes use, if any.

In assembler syntax prototypes, the following conventions are used:

`< >` Angle brackets. Any symbol enclosed by these is a name or a value that the user supplies. For each symbol, there is a description of what the symbol represents. The description usually also specifies which encoding field or fields encodes the symbol.

`{ }` Brace brackets. Any symbols enclosed by these are optional. For each optional symbol, there is a description of what the symbol represents and how its presence or absence is encoded.

In some assembler syntax prototypes, some brace brackets are mandatory, for example if they surround a register list. When the use of brace brackets is mandatory, they are separated from other syntax items by one or more spaces.

`#` This usually precedes a numeric constant. All uses of # are optional in A64 assembler source code. ARM recommends that disassemblers output the # where the assembler syntax prototype includes it.

`+/-` This indicates an optional + or - sign. If neither is coded, + is assumed.

Single spaces are used for clarity, to separate syntax items. Where a space is mandatory, the assembler syntax prototype shows two or more consecutive spaces.

Any characters not shown in this conventions list must be coded exactly as shown in the assembler syntax prototype. Apart from brace brackets, the characters shown are used as part of a meta-language to define the architectural assembler syntax for an instruction encoding or alias, but have no architecturally defined significance in the input to an assembler or in the output from a disassembler.

The following symbol conventions are used:

`<Xn>` The 64-bit name of a general-purpose register (X0-X30) or the zero register (XZR).

`<Wn>` The 32-bit name of a general-purpose register (W0-W30) or the zero register (WZR).

`<Xn|SP>` The 64-bit name of a general-purpose register (X0-X30) or the current stack pointer (SP).

`<Wn|WSP>` The 32-bit name of a general-purpose register (W0-W30) or the current stack pointer (WSP).

`<Bn>, <Hn>, <Sn>, <Dn>, <Qn>`

The 8, 16, 32, 64 or 128-bit name of a SIMD and floating-point register in a scalar context as described in section *Register names* on page C1-122.

`<Vn>` The name of a SIMD and floating-point register name in a vector context as described in *Register names* on page C1-122.

If the description of a symbol specifies that the symbol is a register, the description might also specify that the range of permitted registers is extended or restricted. It also specifies any differences from the default rules for such fields.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

*Register names* on page C1-122 provides the A64 register names.

### C2.1.6 Pseudocode describing how the instruction operates

The *Operation* subsection of the instruction description contains this pseudocode.

It is encoding-independent pseudocode that provides a precise description of what the instruction does.

**Note**

For a description of ARM pseudocode, see Appendix K11 *ARM Pseudocode Definition*. This appendix also describes the execution model for an instruction.

### C2.1.7 Notes, if applicable

If applicable, other notes about the instruction appear under additional subheadings.

Non-Confidential - Beta

## C2.2 Conventions used in AArch64 instruction and System register descriptions

This section provides general information about the AArch64 instruction and System register descriptions.

The terms defined in *Fixed values in AArch64 instruction and System register descriptions* apply to the AArch64 descriptions throughout this manual.

### C2.2.1 Fixed values in AArch64 instruction and System register descriptions

This section summarizes the terms used to describe fixed values in AArch64 register and instruction descriptions. The Glossary gives full descriptions of these terms, and each entry in this section includes a link to the corresponding Glossary entry.

**Note**

In register descriptions, the meaning of some bits depends on the PE state. This affects the definitions of RES0 and RES1, as shown in the Glossary.

The following terms are used to describe bits or fields with fixed values:

**RAZ** Read-As-Zero. See *Read-As-Zero (RAZ)*.

In diagrams, a RAZ bit can be shown as 0.

**(0), RES0** Reserved, *Should-Be-Zero (SBZ)* or *RES0*.

In instruction encoding diagrams, and sometimes in other descriptions, `(0)` indicates an SBZ bit. If the bit is set to 1, behavior is CONSTRAINED UNPREDICTABLE, and must be one of the following:

- The instruction is UNDEFINED.
- The instruction is treated as a `NOP`.
- The instruction executes as if the value of the bit was 0.
- Any destination registers of the instruction become UNKNOWN.

This notation can be expanded for fields, so a three-bit field can be shown as either `(0)(0)(0)` or as `(000)`.

In register diagrams, but not in the A64 encoding and instruction descriptions, bits or fields can be shown as RES0. See the Glossary definition of RES0 for more information.

**Note**

Some of the System instruction descriptions in this chapter are based on the *field description* of the input value for the instruction. These are register descriptions and therefore can include RES0 fields,

The `(0)` and RES0 descriptions can be applied to bits or bitfields that are read-only, or are write-only. The Glossary definitions cover these cases.

**RAO** Read-As-One. See *Read-As-One (RAO)*.

In diagrams, a RAO bit can be shown as 1.

**(1), RES1** Reserved, *Should-Be-One (SBO)* or *RES1*.

In instruction encoding diagrams, and sometimes in other descriptions, `(1)` indicates a SBO bit. If the bit is set to 0, behavior is CONSTRAINED UNPREDICTABLE, and must be one of the following:

- The instruction is UNDEFINED.
- The instruction is treated as a `NOP`.
- The instruction executes as if the value of the bit was 1.
- Any destination registers of the instruction become UNKNOWN.

This notation can be expanded for fields, so a three-bit field can be shown as either `(1)(1)(1)` or as `(111)`.

In register diagrams, but not in the A64 encoding and instruction descriptions, bits or fields can be shown as RES1. See the Glossary definition of RES1 for more information.

**Note**

Some of the System instruction descriptions in this chapter are based on the *field description* of the input value for the instruction. These are register descriptions and therefore can include RES1 fields,

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The (1) and RES1 descriptions can be applied to bits or bitfields that are read-only, or are write-only. The Glossary definitions cover these cases.

# Chapter C3
# A64 Instruction Set Overview

This chapter provides an overview of the A64 instruction set. It contains the following sections:

- *Branches, Exception generating, and System instructions* on page C3-138.
- *Loads and stores* on page C3-142.
- *Data processing - immediate* on page C3-153.
- *Data processing - register* on page C3-158.
- *Data processing - SIMD and floating-point* on page C3-165.

For a structured breakdown of instruction groups by encoding, see Chapter C4 *A64 Instruction Set Encoding*.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## C3.1 Branches, Exception generating, and System instructions

This section describes the branch, exception generating, and system instructions. It contains the following subsections:

- *Conditional branch*.
- *Unconditional branch (immediate)*.
- *Unconditional branch (register)* on page C3-139.
- *Exception generation and return* on page C3-139.
- *System register instructions* on page C3-140.
- *System instructions* on page C3-140.
- *Hint instructions* on page C3-141.
- *Barriers and CLREX instructions* on page C3-141.

For information about the encoding structure of the instructions in this instruction group, see *Branches, exception generating and system instructions* on page C4-191.

**Note**

Software must:

- Use only `BLR` or `BL` to perform a nested subroutine call when that subroutine is expected to return to the immediately following instruction, that is, the instruction with the address of the `BLR` or `BL` instruction incremented by four.
- Use only `RET` to perform a subroutine return, when that subroutine is expected to have been entered by a `BL` or `BLR` instruction.
- Use only `B`, `BR`, or the instructions listed in Table C3-1 to perform a control transfer that is not a subroutine call or subroutine return described in this *Note*.

### C3.1.1 Conditional branch

Conditional branches change the flow of execution depending on the current state of the condition flags or the value in a general-purpose register. See Table C1-1 on page C1-122 for a list of the condition codes that can be used for `cond`.

Table C3-1 shows the Conditional branch instructions.

**Table C3-1 Conditional branch instructions**

| Mnemonic | Instruction | Branch offset range from the PC | See |
|---|---|---|---|
| `B.cond` | Branch conditionally | ±1MB | *B.cond* on page C6-462 |
| `CBNZ` | Compare and branch if nonzero | ±1MB | *CBNZ* on page C6-476 |
| `CBZ` | Compare and branch if zero | ±1MB | *CBZ* on page C6-477 |
| `TBNZ` | Test bit and branch if nonzero | ±32KB | *TBNZ* on page C6-810 |
| `TBZ` | Test bit and branch if zero | ±32KB | *TBZ* on page C6-811 |

### C3.1.2 Unconditional branch (immediate)

Unconditional branch (immediate) instructions change the flow of execution unconditionally by adding an immediate offset with a range of ±128MB to the value of the program counter that fetched the instruction. The `BL` instruction also writes the address of the sequentially following instruction to general-purpose register, X30.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Table C3-2 shows the Unconditional branch instructions with an immediate branch offset.

**Table C3-2 Unconditional branch instructions (immediate)**

| Mnemonic | Instruction | Immediate branch offset range from the PC | See |
|---|---|---|---|
| B | Branch unconditionally | ±128MB | *B* on page C6-463 |
| BL | Branch with link | ±128MB | *BL* on page C6-472 |

### C3.1.3 Unconditional branch (register)

Unconditional branch (register) instructions change the flow of execution unconditionally by setting the program counter to the value in a general-purpose register. The BLR instruction also writes the address of the sequentially following instruction to general-purpose register X30. The RET instruction behaves identically to BR, but provides an additional hint to the PE that this is a return from a subroutine. Table C3-3 shows Unconditional branch instructions that jump directly to an address held in a general-purpose register.

**Table C3-3 Unconditional branch instructions (register)**

| Mnemonic | Instruction | See |
|---|---|---|
| BLR | Branch with link to register | *BLR* on page C6-473 |
| BR | Branch to register | *BR* on page C6-474 |
| RET | Return from subroutine | *RET* on page C6-695 |

### C3.1.4 Exception generation and return

This section describes the following exceptions:

- *Exception generating*.
- *Exception return* on page C3-140.
- *Debug state* on page C3-140.

#### Exception generating

Table C3-4 shows the Exception generating instructions.

**Table C3-4 Exception generating instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| BRK | Software Breakpoint Instruction | *BRK* on page C6-475 |
| HLT | Halting Software Breakpoint Instruction | *HLT* on page C6-531 |
| HVC | Generate exception targeting Exception level 2 | *HVC* on page C6-532 |
| SMC | Generate exception targeting Exception level 3 | *SMC* on page C6-718 |
| SVC | Generate exception targeting Exception level 1 | *SVC* on page C6-803 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Exception return

Table C3-5 shows the Exception return instructions.

**Table C3-5 Exception return instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ERET | Exception return using current ELR and SPSR | *ERET* on page C6-526 |

### Debug state

Table C3-6 shows the Debug state instructions.

**Table C3-6 Debug state instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| DCPS1 | Debug switch to Exception level 1 | *DCPS1* on page C6-512 |
| DCPS2 | Debug switch to Exception level 2 | *DCPS2* on page C6-513 |
| DCPS3 | Debug switch to Exception level 3 | *DCPS3* on page C6-514 |
| DRPS | Debug restore PE state | *DRPS* on page C6-517 |

## C3.1.5 System register instructions

For detailed information about the System register instructions, see Chapter C5 *The A64 System Instruction Class*. Table C3-7 shows the System register instructions.

**Table C3-7 System register instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| MRS | Move System register to general-purpose register | *MRS* on page C6-660 |
| MSR | • Move general-purpose register to System register<br>• Move immediate to PE state field | • *MSR (register)* on page C6-663<br>• *MSR (immediate)* on page C6-661 |

## C3.1.6 System instructions

For detailed information about the System instructions, see Chapter C5 *The A64 System Instruction Class*.

Table C3-8 shows the System instructions.

**Table C3-8 System instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| SYS | System instruction | *SYS* on page C6-807 |
| SYSL | System instruction with result | *SYSL* on page C6-809 |
| IC | Instruction cache maintenance | *IC* on page C6-533 and Table C5-2 on page C5-272 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table C3-8 System instructions (continued)**

| Mnemonic | Instruction | See |
|---|---|---|
| DC | Data cache maintenance | *DC* on page C6-511 and Table C5-2 on page C5-272 |
| AT | Address translation | *AT* on page C6-461 and Table C5-3 on page C5-273 |
| TLBI | TLB Invalidate | *TLBI* on page C6-812 and Table C5-4 on page C5-274 |

### C3.1.7 Hint instructions

Table C3-9 shows the Hint instructions.

**Table C3-9 Hint instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| NOP | No operation | *NOP* on page C6-675 |
| YIELD | Yield hint | *YIELD* on page C6-833 |
| WFE | Wait for event | *WFE* on page C6-831 |
| WFI | Wait for interrupt | *WFI* on page C6-832 |
| SEV | Send event | *SEV* on page C6-714 |
| SEVL | Send event local | *SEVL* on page C6-715 |
| HINT | Unallocated hint | *HINT* on page C6-529 |

### C3.1.8 Barriers and CLREX instructions

Table C3-10 shows the barrier and CLREX instructions.

**Table C3-10 Barriers and CLREX instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| CLREX | Clear exclusive monitor | *CLREX* on page C6-484 |
| DSB | Data synchronization barrier | *DSB* on page C6-518 |
| DMB | Data memory barrier | *DMB* on page C6-515 |
| ISB | Instruction synchronization barrier | *ISB* on page C6-534 |

For more information about the barriers, see *Memory barriers* on page B2-86.

For information about the allocated values for the data barriers, see:

- *DMB* on page C6-515.
- *DSB* on page C6-518.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C3.2 Loads and stores

This section describes the Load/Store instructions. It contains the following subsections:

- *Load/Store register*.
- *Load/Store register (unscaled offset)* on page C3-143.
- *Load/Store Pair* on page C3-144.
- *Load/Store Non-temporal Pair* on page C3-145.
- *Load/Store Unprivileged* on page C3-145.
- *Load-Exclusive/Store-Exclusive* on page C3-146.
- *Load-Acquire/Store-Release* on page C3-147.
- *Load/Store scalar SIMD and floating-point* on page C3-147.
- *Load/Store Vector* on page C3-150.
- *Prefetch memory* on page C3-151.

Apart from Load-Exclusive, Store-Exclusive, Load-Acquire, and Store-Release, addresses can have any alignment unless strict alignment checking is enabled, that is if SCTLR_ELx.A == 1.

The additional control bits SCTLR_ELx.SA and SCTLR_EL1.SA0 control whether the stack pointer must be quadword aligned when used as a base register. See *Stack pointer alignment checking* on page D1-1531. Using a misaligned stack pointer generates a Stack Alignment exception.

For information about the encoding structure of the instructions in this instruction group, see *Loads and stores* on page C4-196.

**Note**

In some cases, Load/Store instructions can lead to CONSTRAINED UNPREDICTABLE behavior. See *Constraints on AArch64 state UNPREDICTABLE behaviors* on page K1-5501.

### C3.2.1 Load/Store register

The Load/Store register instructions support the following addressing modes:

- Base plus a scaled 12-bit unsigned immediate offset or base plus an unscaled 9-bit signed immediate offset.
- Base plus a 64-bit register offset, optionally scaled.
- Base plus a 32-bit extended register offset, optionally scaled.
- Pre-indexed by an unscaled 9-bit signed immediate offset.
- Post-indexed by an unscaled 9-bit signed immediate offset.
- PC-relative literal for loads of 32 bits or more.

See also *Load/Store addressing modes* on page C1-126.

If a Load instruction specifies writeback and the register being loaded is also the base register, then one of the following behaviors occurs:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs the load using the specified addressing mode and the base register becomes UNKNOWN. In addition, if an exception occurs during the execution of such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If a Store instruction performs a writeback and the register that is stored is also the base register, then one of the following behaviors occurs:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- The instruction performs the store to the designated register using the specified addressing mode, but the value stored is UNKNOWN.

Table C3-11 shows the Load/Store Register instructions.

**Table C3-11 Load/Store register instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDR | • Load register (register offset)<br>• Load register (immediate offset)<br>• Load register (PC-relative literal) | • *LDR (register)* on page C6-567<br>• *LDR (immediate)* on page C6-561<br>• *LDR (literal)* on page C6-565 |

### C3.2.2 Load/Store register (unscaled offset)

The Load/Store register instructions with an unscaled offset support only one addressing mode:

- Base plus an unscaled 9-bit signed immediate offset.

See *Load/Store addressing modes* on page C1-126.

The Load/Store register (unscaled offset) instructions are required to disambiguate this instruction class from the Load/Store register instruction forms that support an addressing mode of base plus a scaled, unsigned 12-bit immediate offset, because that can represent some offset values in the same range.

The ambiguous immediate offsets are byte offsets that are both:

- In the range 0-255, inclusive.
- Naturally aligned to the access size.

Other byte offsets in the range -256 to 255 inclusive are unambiguous. An assembler program translating a Load/Store instruction, for example LDR, is required to encode an unambiguous offset using the unscaled 9-bit offset form, and to encode an ambiguous offset using the scaled 12-bit offset form. A programmer might force the generation of the unscaled 9-bit form by using one of the mnemonics in Table C3-12 on page C3-144. ARM recommends that a disassembler outputs all unscaled 9-bit offset forms using one of these mnemonics, but unambiguous offsets can be output using a Load/Store single register mnemonic, for example, LDR.

Non-Confidential - Beta

Table C3-12 shows the Load/Store register instructions with an unscaled offset.

**Table C3-12 Load/Store register (unscaled offset) instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDUR | Load register (unscaled offset) | *LDUR* on page C6-616 |
| LDURB | Load byte (unscaled offset) | *LDURB* on page C6-618 |
| LDURSB | Load signed byte (unscaled offset) | *LDURSB* on page C6-622 |
| LDURH | Load halfword (unscaled offset) | *LDURH* on page C6-620 |
| LDURSH | Load signed halfword (unscaled offset) | *LDURSH* on page C6-624 |
| LDURSW | Load signed word (unscaled offset) | *LDURSW* on page C6-626 |
| STUR | Store register (unscaled offset) | *STUR* on page C6-771 |
| STURB | Store byte (unscaled offset) | *STURB* on page C6-773 |
| STURH | Store halfword (unscaled offset) | *STURH* on page C6-775 |

### C3.2.3 Load/Store Pair

The Load/Store Pair instructions support the following addressing modes:

- Base plus a scaled 7-bit signed immediate offset.
- Pre-indexed by a scaled 7-bit signed immediate offset.
- Post-indexed by a scaled 7-bit signed immediate offset.

See also *Load/Store addressing modes* on page C1-126.

If a Load Pair instruction specifies the same register for the two registers that are being loaded, then one of the following behaviors occurs:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs all the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

If a Load Pair instruction specifies writeback and one of the registers being loaded is also the base register, then one of the following behaviors occurs:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs all of the loads using the specified addressing mode, and the base register becomes UNKNOWN. In addition, if an exception occurs during the instruction, the base address might be corrupted so that the instruction cannot be repeated.

If a Store Pair instruction performs a writeback and one of the registers being stored is also the base register, then one of the following behaviors occurs:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs all the stores of the registers indicated by the specified addressing mode, but the value stored for the base register is UNKNOWN.

Table C3-13 shows the Load/Store Pair instructions.

**Table C3-13 Load/Store Pair instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDP | Load Pair | *LDP* on page C6-554 |
| LDPSW | Load Pair signed words | *LDPSW* on page C6-558 |
| STP | Store Pair | *STP* on page C6-742 |

### C3.2.4 Load/Store Non-temporal Pair

The Load/Store Non-temporal Pair instructions support only one addressing mode:

- Base plus a scaled 7-bit signed immediate offset.

See *Load/Store addressing modes* on page C1-126.

The Load/Store Non-temporal Pair instructions provide a hint to the memory system that an access is non-temporal or streaming, and unlikely to be repeated in the near future. This means that data caching is not required. However, depending on the memory type, the instructions might permit memory reads to be preloaded and memory writes to be gathered to accelerate bulk memory transfers.

In addition there is an exception to the usual memory ordering rules. If an address dependency exists between two memory reads, and a Load Non-temporal Pair instruction generated the second read, then in the absence of any other barrier mechanism to achieve order, the memory accesses can be observed in any order by the other observers within the shareability domain of the memory addresses being accessed.

If a Load Non-Temporal Pair instruction specifies the same register for the two registers that are being loaded, then one of the following can occur:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs all the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

Table C3-14 shows the Load/Store Non-temporal Pair instructions.

**Table C3-14 Load/Store Non-temporal Pair instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDNP | Load Non-temporal Pair | *LDNP* on page C6-552 |
| STNP | Store Non-temporal Pair | *STNP* on page C6-740 |

### C3.2.5 Load/Store Unprivileged

The Load/Store Unprivileged instructions support only one addressing mode:

- Base plus an unscaled 9-bit signed immediate offset.

See *Load/Store addressing modes* on page C1-126.

The Load/Store Unprivileged instructions can be used when the PE is at EL1 to perform unprivileged memory accesses. If the PE is executing in any other Exception level, then the access permissions for that level apply.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Table C3-15 shows the Load/Store Unprivileged instructions.

**Table C3-15 Load-Store Unprivileged instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDTR | Load Unprivileged register | *LDTR* on page C6-601 |
| LDTRB | Load Unprivileged byte | *LDTRB* on page C6-604 |
| LDTRSB | Load Unprivileged signed byte | *LDTRSB* on page C6-608 |
| LDTRH | Load Unprivileged halfword | *LDTRH* on page C6-606 |
| LDTRSH | Load Unprivileged signed halfword | *LDTRSH* on page C6-611 |

| STTR | Store Unprivileged register | *STTR* on page C6-764 |
| STTRB | Store Unprivileged byte | *STTRB* on page C6-767 |
| STTRH | Store Unprivileged halfword | *STTRH* on page C6-769 |

### C3.2.6 Load-Exclusive/Store-Exclusive

The Load-Exclusive/Store-Exclusive instructions support only one addressing mode:

- Base register with no offset.

See *Load/Store addressing modes* on page C1-126.

The Load-Exclusive instructions mark the physical address being accessed as an exclusive access. This exclusive access mark is checked by the Store-Exclusive instruction, permitting the construction of atomic read-modify-write operations on shared memory variables, semaphores, mutexes, and spinlocks. See *Synchronization and semaphores* on page B2-107.

The Load-Exclusive/Store-Exclusive instructions other than Load-Exclusive pair and Store-Exclusive pair require natural alignment, and an unaligned address generates an Alignment fault. Memory accesses generated by Load-Exclusive pair or Store-Exclusive pair instructions must be aligned to the size of the pair, otherwise the access generates an Alignment fault. When a Store-Exclusive pair succeeds, it causes a single-copy atomic update of the entire memory location.

Table C3-16 shows the Load-Exclusive/Store-Exclusive instructions.

**Table C3-16 Load-Exclusive/Store-Exclusive instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDXR | Load Exclusive register | *LDXR* on page C6-631 |
| LDXRB | Load Exclusive byte | *LDXRB* on page C6-634 |

### C3.2.7 Load-Acquire/Store-Release

The Load-Acquire/Store-Release instructions support only one addressing mode:

- Base register with no offset.

See *Load/Store addressing modes* on page C1-126.

The Load-Acquire/Store-Release instructions can remove the requirement to use the explicit DMB memory barrier instruction. For more information about the ordering of Load-Acquire/Store-Release, see *Load-Acquire, Store-Release* on page B2-89.

The Load-Acquire/Store-Release instructions other than Load-Acquire pair and Store-Release pair require natural alignment, and an unaligned address generates an Alignment fault. Memory accesses generated by Load-Acquire pair or Store-Release pair instructions must be aligned to the size of the pair, otherwise the access generates an Alignment fault.

A Store-Release Exclusive instruction only has the Release semantics if the store is successful.

Table C3-17 shows the Non-exclusive Load-Acquire/Store-Release instructions.

**Table C3-17 Non-exclusive Load-Acquire and Store-Release instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDAR | Load-Acquire register | *LDAR* on page C6-536 |
| LDARB | Load-Acquire byte | *LDARB* on page C6-538 |
| LDARH | Load-Acquire halfword | *LDARH* on page C6-539 |

| STLXP | Store-Release Exclusive pair | *STLXP* on page C6-728 |

### C3.2.8 Load/Store scalar SIMD and floating-point

The Load/Store scalar SIMD and floating-point instructions operate on scalar values in the SIMD and floating-point register file as described in *SIMD and floating-point scalar register names* on page C1-124. The memory addressing modes available, described in *Load/Store addressing modes* on page C1-126, are identical to the general-purpose register Load/Store instructions, and like those instructions permit arbitrary address alignment unless strict

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

alignment checking is enabled. However, unlike the Load/Store instructions that transfer general-purpose registers, Load/Store scalar SIMD and floating-point instructions make no guarantee of atomicity, even when the address is naturally aligned to the size of the data.

### Load/Store scalar SIMD and floating-point register

The Load/Store scalar SIMD and floating-point register instructions support the following addressing modes:

- Base plus a scaled 12-bit unsigned immediate offset or base plus unscaled 9-bit signed immediate offset.
- Base plus 64-bit register offset, optionally scaled.
- Base plus 32-bit extended register offset, optionally scaled.
- Pre-indexed by an unscaled 9-bit signed immediate offset.
- Post-indexed by an unscaled 9-bit signed immediate offset.
- PC-relative literal for loads of 32 bits or more.

For more information on the addressing modes, see *Load/Store addressing modes* on page C1-126.

**Note**

The unscaled 9-bit signed immediate offset address mode requires its own instruction form, see *Load/Store scalar SIMD and floating-point register (unscaled offset)*.

Table C3-19 shows the Load/Store instructions for a single SIMD and floating-point register.

**Table C3-19 Load/Store single SIMD and floating-point register instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDR | Load scalar SIMD&FP register (register offset) | *LDR (register, SIMD&FP)* on page C7-1139 |
| | Load scalar SIMD&FP register (immediate offset) | *LDR (immediate, SIMD&FP)* on page C7-1133 |
| | Load scalar SIMD &FP register (PC-relative literal) | *LDR (literal, SIMD&FP)* on page C7-1137 |
| STR | Store scalar SIMD &FP register (register offset) | *STR (register, SIMD&FP)* on page C7-1386 |
| | Store scalar SIMD &FP register (immediate offset) | *STR (immediate, SIMD&FP)* on page C7-1382 |

### Load/Store scalar SIMD and floating-point register (unscaled offset)

The Load /Store scalar SIMD and floating-point register instructions support only one addressing mode:

- Base plus an unscaled 9-bit signed immediate offset.

See also *Load/Store addressing modes* on page C1-126.

The Load/Store scalar SIMD and floating-point register (unscaled offset) instructions are required to disambiguate this instruction class from the Load/Store single SIMD and floating-point instruction forms that support an addressing mode of base plus a scaled, unsigned 12-bit immediate offset. This is similar to the Load/Store register (unscaled offset) instructions, that disambiguate this instruction class from the Load/Store register instruction, see *Load/Store register (unscaled offset)* on page C3-143.

Table C3-20 shows the Load/Store SIMD and floating-point register instructions with an unscaled offset.

**Table C3-20 Load/Store SIMD and floating-point register instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDUR | Load scalar SIMD&FP register (unscaled offset) | *LDUR (SIMD&FP)* on page C7-1142 |
| STUR | Store scalar SIMD&FP register (unscaled offset) | *STUR (SIMD&FP)* on page C7-1389 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Load/Store SIMD and Floating-point register pair

The Load/Store SIMD and floating-point register pair instructions support the following addressing modes:

- Base plus a scaled 7-bit signed immediate offset.
- Pre-indexed by a scaled 7-bit signed immediate offset.
- Post-indexed by a scaled 7-bit signed immediate offset.

See also *Load/Store addressing modes* on page C1-126.

If a Load pair instruction specifies the same register for the two registers that are being loaded, then one of the following occurs:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the register being loaded takes an UNKNOWN value.

Table C3-21 shows the Load/Store SIMD and floating-point register pair instructions.

**Table C3-21 Load/Store SIMD and floating-point register pair instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDP | Load pair of scalar SIMD&FP registers | *LDP (SIMD&FP)* on page C7-1130 |
| STP | Store pair of scalar SIMD&FP registers | *STP (SIMD&FP)* on page C7-1379 |

### Load/Store SIMD and Floating-point Non-temporal pair

The Load/Store SIMD and Floating-point Non-temporal pair instructions support only one addressing mode:

- Base plus a scaled 7-bit signed immediate offset.

See also *Load/Store addressing modes* on page C1-126.

The Load/Store Non-temporal pair instructions provide a hint to the memory system that an access is non-temporal or streaming, and unlikely to be repeated in the near future. This means that data caching is not required. However, depending on the memory type, the instructions might permit memory reads to be preloaded and memory writes to be gathered to accelerate bulk memory transfers.

In addition there is an exception to the usual memory ordering rules. If an address dependency exists between two memory reads, and a Load non-temporal pair instruction generated the second read, then in the absence of any other barrier mechanism to achieve order, those memory accesses can be observed in any order by the other observers within the shareability domain of the memory addresses being accessed.

If a Load Non-temporal pair instruction specifies the same register for the two registers that are being loaded, then one of the following occurs:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs all the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

Non-Confidential - Beta

Table C3-22 shows the Load/Store SIMD and floating-point Non-temporal pair instructions.

**Table C3-22 Load/Store SIMD and floating-point Non-temporal pair instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDNP | Load pair of scalar SIMD&FP registers | *LDNP (SIMD&FP)* on page C7-1128 |
| STNP | Store pair of scalar SIMD&FP registers | *STNP (SIMD&FP)* on page C7-1377 |

### C3.2.9 Load/Store Vector

The Vector Load/Store structure instructions support the following addressing modes:

- Base register only.
- Post-indexed by a 64-bit register.
- Post-indexed by an immediate, equal to the number of bytes transferred.

Load/Store vector instructions, like other Load/Store instructions, allow any address alignment, unless strict alignment checking is enabled. If strict alignment checking is enabled, then alignment checking to the size of the element is performed. However, unlike the Load/Store instructions that transfer general-purpose registers, the Load/Store vector instructions do not guarantee atomicity, even when the address is naturally aligned to the size of the element.

#### Load/Store structures

Table C3-23 shows the Load/Store structure instructions. A post-increment immediate offset, if present, must be 8, 16, 24, 32, 48, or 64, depending on the number of elements transferred.

**Table C3-23 Load/Store multiple structures instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LD1 | • Load single 1-element structure to one lane of one register<br>• Load multiple 1-element structures to one register or to two, three or four consecutive registers | • *LD1 (single structure)* on page C7-1092<br>• *LD1 (multiple structures)* on page C7-1088 |
| LD2 | • Load single 2-element structure to one lane of two consecutive registers<br>• Load multiple 2-element structures to two consecutive registers | • *LD2 (single structure)* on page C7-1101<br>• *LD2 (multiple structures)* on page C7-1098 |

**Table C3-23 Load/Store multiple structures instructions (continued)**

| Mnemonic | Instruction | See |
|---|---|---|
| ST2 | • Store single 2-element structure from one lane of two consecutive registers<br>• Store multiple 2-element structures from two consecutive registers | • *ST2 (single structure)* on page C7-1359<br>• *ST2 (multiple structures)* on page C7-1356 |
| ST3 | • Store single 3-element structure from one lane of three consecutive registers<br>• Store multiple 3-element structures from three consecutive registers | • *ST3 (single structure)* on page C7-1366<br>• *ST3 (multiple structures)* on page C7-1363 |
| ST4 | • Store single 4-element structure from one lane of four consecutive registers<br>• Store multiple 4-element structures from four consecutive registers | • *ST4 (single structure)* on page C7-1373<br>• *ST4 (multiple structures)* on page C7-1370 |

### Load single structure and replicate

Table C3-24 shows the Load single structure and replicate instructions. A post-increment immediate offset, if present, must be 1, 2, 3, 4, 6, 8, 12, 16, 24, or 32, depending on the number of elements transferred.

**Table C3-24 Load single structure and replicate instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LD1R | Load single 1-element structure and replicate to all lanes of one register | *LD1R* on page C7-1095 |
| LD2R | Load single 2-element structure and replicate to all lanes of two registers | *LD2R* on page C7-1105 |
| LD3R | Load single 3-element structure and replicate to all lanes of three registers | *LD3R* on page C7-1115 |
| LD4R | Load single 4-element structure and replicate to all lanes of four registers | *LD4R* on page C7-1125 |

## C3.2.10 Prefetch memory

The Prefetch memory instructions support the following addressing modes:

- Base plus a scaled 12-bit unsigned immediate offset or base plus an unscaled 9-bit signed immediate offset.
- Base plus a 64-bit register offset. This can be optionally scaled by 8-bits, for example LSL#3.
- Base plus a 32-bit extended register offset. This can be optionally scaled by 8-bits.
- PC-relative literal.

The prefetch memory instructions signal to the memory system that memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory access when they do occur, such as pre-loading the specified address into one or more caches. Because these signals are only hints, it is valid for the PE to treat any or all prefetch instructions as a NOP.

Because they are hints to the memory system, the operation of a PRFM instruction cannot cause a synchronous exception. However, a memory operation performed as a result of one of these memory system hints might in exceptional cases trigger an asynchronous event, and thereby influence the execution of the PE. An example of an asynchronous event that might be triggered is a SError interrupt.

A PRFM instruction can only have an effect on software visible structures, such as caches and translation lookaside buffers associated with memory locations that can be accessed by reads, writes, or execution as defined in the translation regime of the current Exception level.

A PRFM instruction is guaranteed not to access Device memory.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

A PRFM instruction using a PLI hint must not result in any access that could not be performed by the PE speculatively fetching an instruction. Therefore, if all associated MMUs are disabled, a PLI hint cannot access any memory location that cannot be accessed by instruction fetches.

The PRFM instructions require an additional <prfop> operand to be specified, which must be one of the following:

PLDL1KEEP, PLDL1STRM, PLDL2KEEP, PLDL2STRM, PLDL3KEEP, PLDL3STRM

PSTL1KEEP, PSTL1STRM, PSTL2KEEP, PSTL2STRM, PSTL3KEEP, PSTL3STRM

PLIL1KEEP, PLIL1STRM, PLIL2KEEP, PLIL2STRM, PLIL3KEEP, PLIL3STRM

<prfop> is defined as <type><target><policy>.

Here:

| | | |
|---|---|---|
| <type> | Is one of: | |
| | PLD | Prefetch for load. |
| | PST | Prefetch for store. |
| | PLI | Preload instructions. |
| <target> | Is one of: | |
| | L1 | Level 1 cache. |
| | L2 | Level 2 cache. |
| | L3 | Level 3 cache. |
| <policy> | Is one of: | |
| | KEEP | Retained or temporal prefetch, allocated in the cache normally. |
| | STRM | Streaming or non-temporal prefetch, for data that is used only once. |

PRFUM explicitly uses the unscaled 9-bit signed immediate offset addressing mode, as described in *Load/Store register (unscaled offset)* on page C3-143.

Table C3-25 shows the Prefetch memory instructions.

**Table C3-25 Prefetch memory instructions**

## C3.3 Data processing - immediate

This section describes the instruction groups for data processing with immediate operands. It contains the following subsections:

- *Arithmetic (immediate)*.
- *Logical (immediate)*.
- *Move (wide immediate)* on page C3-154.
- *Move (immediate)* on page C3-154.
- *PC-relative address calculation* on page C3-155.
- *Bitfield move* on page C3-155.
- *Bitfield insert and extract* on page C3-156
- *Extract register* on page C3-156.
- *Shift (immediate)* on page C3-156.
- *Sign-extend and Zero-extend* on page C3-156.

For information about the encoding structure of the instructions in this instruction group, see *Data processing - immediate* on page C4-187.

### C3.3.1 Arithmetic (immediate)

The Arithmetic (immediate) instructions accept a 12-bit unsigned immediate value, optionally shifted left by 12 bits.

The Arithmetic (immediate) instructions that do not set condition flags can read from and write to the current stack pointer. The flag setting instructions can read from the stack pointer, but they cannot write to it.

Table C3-26 shows the Arithmetic instructions with an immediate offset.

**Table C3-26 Arithmetic instructions with an immediate**

| Mnemonic | Instruction | See |
|---|---|---|
| ADD | Add | *ADD (immediate)* on page C6-437 |
| ADDS | Add and set flags | *ADDS (immediate)* on page C6-444 |
| SUB | Subtract | *SUB (immediate)* on page C6-792 |
| SUBS | Subtract and set flags | *SUBS (immediate)* on page C6-799 |
| CMP | Compare | *CMP (immediate)* on page C6-494 |
| CMN | Compare negative | *CMN (immediate)* on page C6-489 |

### C3.3.2 Logical (immediate)

The Logical (immediate) instructions accept a bitmask immediate value that is a 32-bit pattern or a 64-bit pattern viewed as a vector of identical elements of size e = 2, 4, 8, 16, 32 or, 64 bits. Each element contains the same sub-pattern, that is a single run of 1 to (e - 1) nonzero bits from bit 0 followed by zero bits, then rotated by 0 to (e - 1) bits. This mechanism can generate 5334 unique 64-bit patterns as 2667 pairs of pattern and their bitwise inverse.

**Note**

Values that consist of only zeros or only ones cannot be described in this way.

The Logical (immediate) instructions that do not set the condition flags can write to the current stack pointer, for example to align the stack pointer in a function prologue.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

Apart from ANDS, and its TST alias, Logical (immediate) instructions do not set the condition flags. However, the final results of a bitwise operation can be tested by a CBZ, CBNZ, TBZ, or TBNZ conditional branch.

Table C3-27 shows the Logical immediate instructions.

**Table C3-27 Logical immediate instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| AND | Bitwise AND | *AND (immediate)* on page C6-450 |
| ANDS | Bitwise AND and set flags | *ANDS (immediate)* on page C6-454 |
| EOR | Bitwise exclusive OR | *EOR (immediate)* on page C6-522 |
| ORR | Bitwise inclusive OR | *ORR (immediate)* on page C6-678 |
| TST | Test bits | *TST (immediate)* on page C6-814 |

### C3.3.3 Move (wide immediate)

The Move (wide immediate) instructions insert a 16-bit immediate, or inverted immediate, into a 16-bit aligned position in the destination register. The value of the other bits in the destination register depends on the variant used. The optional shift amount can be any multiple of 16 that is smaller than the register size.

Table C3-28 shows the Move (wide immediate) instructions.

**Table C3-28 Move (wide immediate) instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| MOVZ | Move wide with zero | *MOVZ* on page C6-658 |
| MOVN | Move wide with NOT | *MOVN* on page C6-656 |
| MOVK | Move wide with keep | *MOVK* on page C6-654 |

### C3.3.4 Move (immediate)

The Move (immediate) instructions are aliases for a single MOVZ, MOVN, or ORR (immediate with zero register), instruction to load an immediate value into the destination register. An assembler must permit a signed or unsigned immediate, as long as its binary representation can be generated using one of these instructions, and an assembler error results if the immediate cannot be generated in this way. On disassembly it is unspecified whether the immediate is output as a signed or an unsigned value.

If there is a choice between the MOVZ, MOVN, and ORR instruction to encode the immediate, then an assembler must prefer MOVZ to MOVN, and MOVZ or MOVN to ORR, to ensure reversability. A disassembler must output ORR (immediate with zero register) MOVZ, and MOVN, as a MOV mnemonic except that the underlying instruction must be used when:

- ORR has an immediate that can be generated by a MOVZ or MOVN instruction.
- A MOVN instruction has an immediate that can be encoded by MOVZ.
- MOVZ #0 or MOVN #0 have a shift amount other than LSL #0.

Non-Confidential - Beta

Table C3-29 shows the Move (immediate) instructions.

**Table C3-29 Move (immediate) instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| MOV | • Move (inverted wide immediate)<br>• Move (wide immediate)<br>• Move (bitmask immediate) | • *MOV (inverted wide immediate)* on page C6-650<br>• *MOV (wide immediate)* on page C6-651<br>• *MOV (bitmask immediate)* on page C6-652 |

### C3.3.5 PC-relative address calculation

The ADR instruction adds a signed, 21-bit immediate to the value of the program counter that fetched this instruction, and then writes the result to a general-purpose register. This permits the calculation of any byte address within ±1MB of the current PC.

The ADRP instruction shifts a signed, 21-bit immediate left by 12 bits, adds it to the value of the program counter with the bottom 12 bits cleared to zero, and then writes the result to a general-purpose register. This permits the calculation of the address at a 4KB aligned memory region. In conjunction with an ADD (immediate) instruction, or a Load/Store instruction with a 12-bit immediate offset, this allows for the calculation of, or access to, any address within ±4GB of the current PC.

**Note**

The term *page* used in the ADRP description is short-hand for the 4KB memory region, and is not related to the virtual memory translation granule size.

Table C3-30 shows the instructions used for PC-relative address calculations are as follows:

**Table C3-30 PC-relative address calculation instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ADRP | Compute address of 4KB page at a PC-relative offset | *ADRP* on page C6-449 |
| ADR | Compute address of label at a PC-relative offset. | *ADR* on page C6-448 |

### C3.3.6 Bitfield move

The Bitfield move instructions copy a bitfield of constant width from bit 0 in the source register to a constant bit position in the destination register, or from a constant bit position in the source register to bit 0 in the destination register. The remaining bits in the destination register are set as follows:

- For BFM the remaining bits are unchanged.
- For UBFM the lower bits, if any, and upper bits, if any, are set to zero.
- For SBFM the lower bits, if any, are set to zero, and the upper bits, if any, are set to a copy of the most-significant bit in the copied bitfield.

Table C3-31 shows the Bitfield move instructions.

**Table C3-31 Bitfield move instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| BFM | Bitfield move | *BFM* on page C6-465 |
| SBFM | Signed bitfield move | *SBFM* on page C6-710 |
| UBFM | Unsigned bitfield move (32-bit) | *UBFM* on page C6-818 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C3.3.7 Bitfield insert and extract

The Bitfield insert and extract instructions are implemented as aliases of the Bitfield move instructions. Table C3-32 shows the Bitfield insert and extract aliases.

**Table C3-32 Bitfield insert and extract instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| BFI | Bitfield insert | *BFI* on page C6-464 |
| BFXIL | Bitfield extract and insert low | *BFXIL* on page C6-467 |
| SBFIZ | Signed bitfield insert in zero | *SBFIZ* on page C6-709 |
| SBFX | Signed bitfield extract | *SBFX* on page C6-712 |
| UBFIZ | Unsigned bitfield insert in zero | *UBFIZ* on page C6-817 |
| UBFX | Unsigned bitfield extract | *UBFX* on page C6-820 |

### C3.3.8 Extract register

Depending on the register width of the operands, the Extract register instruction copies a 32-bit or 64-bit field from a constant bit position within a double-width value formed by the concatenation of a pair of source registers to a destination register.

Table C3-33 shows the Extract (immediate) instructions.

**Table C3-33 Extract register instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| EXTR | Extract register from pair | *EXTR* on page C6-527 |

### C3.3.9 Shift (immediate)

Shifts and rotates by a constant amount are implemented as aliases of the Bitfield move or Extract register instructions. The shift or rotate amount must be in the range 0 to one less than the register width of the instruction, inclusive.

Table C3-34 shows the aliases that can be used as immediate shift and rotate instructions.

**Table C3-34 Aliases for immediate shift and rotate instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ASR | Arithmetic shift right | *ASR (immediate)* on page C6-459 |
| LSL | Logical shift left | *LSL (immediate)* on page C6-641 |
| LSR | Logical shift right | *LSR (immediate)* on page C6-644 |
| ROR | Rotate right | *ROR (immediate)* on page C6-702 |

### C3.3.10 Sign-extend and Zero-extend

The Sign-extend and Zero-extend instructions are implemented as aliases of the Bitfield move instructions.

Table C3-35 on page C3-157 shows the aliases that can be used as zero-extend and sign-extend instructions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table C3-35 Zero-extend and sign-extend instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| SXTB | Sign-extend byte | *SXTB* on page C6-804 |
| SXTH | Sign-extend halfword | *SXTH* on page C6-805 |
| SXTW | Sign-extend word | *SXTW* on page C6-806 |
| UXTB | Unsigned extend byte | *UXTB* on page C6-829 |
| UXTH | Unsigned extend halfword | *UXTH* on page C6-830 |

## C3.4 Data processing - register

This section describes the instruction groups for data processing with all register operands. It contains the following subsections:

- *Arithmetic (shifted register)*.
- *Arithmetic (extended register)*.
- *Arithmetic with carry* on page C3-159.
- *Logical (shifted register)* on page C3-160.
- *Move (register)* on page C3-161.
- *Shift (register)* on page C3-161.
- *Multiply and divide* on page C3-161.
- *CRC32* on page C3-163.
- *Bit operation* on page C3-163.
- *Conditional select* on page C3-163.
- *Conditional comparison* on page C3-164.

For information about the encoding structure of the instructions in this instruction group, see *Data processing - register* on page C4-218.

### C3.4.1 Arithmetic (shifted register)

The Arithmetic (shifted register) instructions apply an optional shift operator to the second source register value before performing the arithmetic operation. The register width of the instruction controls whether the new bits are fed into the intermediate result on a right shift or rotate at bit[63] or bit[31].

The shift operators `LSL`, `ASR` and `LSR` accept an immediate shift amount in the range 0 to one less than the register width of the instruction, inclusive.

Omitting the shift operator implies `LSL #0`, which means that there is no shift. A disassembler must not output `LSL #0`. However, a disassembler must output all other shifts by zero.

The current stack pointer, SP or WSP, cannot be used with this class of instructions. See *Arithmetic (extended register)* for arithmetic instructions that can operate on the current stack pointer.

Table C3-36 shows the Arithmetic (shifted register) instructions.

**Table C3-36 Arithmetic (shifted register) instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ADD | Add | *ADD (shifted register)* on page C6-439 |
| ADDS | Add and set flags | *ADDS (shifted register)* on page C6-446 |
| SUB | Subtract | *SUB (shifted register)* on page C6-794 |
| SUBS | Subtract and set flags | *SUBS (shifted register)* on page C6-801 |
| CMN | Compare negative | *CMN (shifted register)* on page C6-490 |
| CMP | Compare | *CMP (shifted register)* on page C6-495 |
| NEG | Negate | *NEG (shifted register)* on page C6-669 |
| NEGS | Negate and set flags | *NEGS* on page C6-671 |

### C3.4.2 Arithmetic (extended register)

The extended register instructions provide an optional sign-extension or zero-extension of a portion of the second source register value, followed by an optional left shift by a constant amount of 1-4, inclusive.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The extended shift is described by the mandatory extend operator SXTB, SXTH, SXTW, UXTB, UXTH, or UXTW. This is followed by an optional left shift amount. If the shift amount is not specified, the default shift amount is zero. A disassembler must not output a shift amount of zero.

For 64-bit instruction forms the additional operators UXTX and SXTX use all 64 bits of the second source register with an optional shift. In that case ARM recommends UXTX as the operator. If and only if at least one register is SP, ARM recommends use of the LSL operator name, rather than UXTX, and when the shift amount is also zero then both the operator and the shift amount can be omitted.

For 32-bit instruction forms the operators UXTW and SXTW both use all 32 bits of the second source register with an optional shift. In that case ARM recommends UXTW as the operator. If and only if at least one register is WSP, ARM recommends use of the LSL operator name, rather than UXTW, and when the shift amount is also zero then both the operator and the shift amount can be omitted.

The non-flag setting variants of the extended register instruction permit the use of the current stack pointer as either the destination register and the first source register. The flag setting variants only permit the stack pointer to be used as the first source register.

In the 64-bit form of these instructions the final register operand is written as Wm for all except the UXTX/LSL and SXTX extend operators. For example:

```
CMP X4, W5, SXTW
ADD X1, X2, W3, UXTB #2
SUB SP, SP, X1              // SUB SP, SP, X1, UXTX #0
```

Table C3-37 shows the Arithmetic (extended register) instructions.

**Table C3-37 Arithmetic (extended register) instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ADD | Add | *ADD (extended register)* on page C6-434 |
| ADDS | Add and set flags | *ADDS (extended register)* on page C6-441 |
| SUB | Subtract | *SUB (extended register)* on page C6-789 |
| SUBS | Subtract and set flags | *SUBS (extended register)* on page C6-796 |
| CMN | Compare negative | *CMN (extended register)* on page C6-487 |
| CMP | Compare | *CMP (extended register)* on page C6-492 |

### C3.4.3 Arithmetic with carry

The Arithmetic with carry instructions accept two source registers, with the carry flag as an additional input to the calculation. They do not support shifting of the second source register.

Table C3-38 shows the Arithmetic with carry instructions

**Table C3-38 Arithmetic with carry instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ADC | Add with carry | *ADC* on page C6-432 |
| ADCS | Add with carry and set flags | *ADCS* on page C6-433 |
| SBC | Subtract with carry | *SBC* on page C6-705 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table C3-38 Arithmetic with carry instructions (continued)**

| Mnemonic | Instruction | See |
|---|---|---|
| SBCS | Subtract with carry and set flags | *SBCS* on page C6-707 |
| NGC | Negate with carry | *NGC* on page C6-673 |
| NGCS | Negate with carry and set flags | *NGCS* on page C6-674 |

### C3.4.4 Logical (shifted register)

The Logical (shifted register) instructions apply an optional shift operator to the second source register value before performing the main operation. The register width of the instruction controls whether the new bits are fed into the intermediate result on a right shift or rotate at bit[63] or bit[31].

The shift operators LSL, ASR, LSR and ROR accept a constant immediate shift amount in the range 0 to one less than the register width of the instruction, inclusive.

Omitting the shift operator and amount implies LSL #0, which means that there is no shift. A disassembler must not output LSL #0. However, a disassembler must output all other shifts by zero.

**Note**

Apart from ANDS, TST and BICS the logical instructions do not set the condition flags, but the final result of a bit operation can usually directly control a CBZ, CBNZ, TBZ, or TBNZ conditional branch.

Table C3-39 shows the Logical (shifted register) instructions.

**Table C3-39 Logical (shifted register) instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| AND | Bitwise AND | *AND (shifted register)* on page C6-452 |
| ANDS | Bitwise AND and set flags | *ANDS (shifted register)* on page C6-456 |
| BIC | Bitwise bit clear | *BIC (shifted register)* on page C6-468 |
| BICS | Bitwise bit clear and set flags | *BICS (shifted register)* on page C6-470 |
| EON | Bitwise exclusive OR NOT | *EON (shifted register)* on page C6-520 |
| EOR | Bitwise exclusive OR | *EOR (shifted register)* on page C6-524 |
| ORR | Bitwise inclusive OR | *ORR (shifted register)* on page C6-680 |
| MVN | Bitwise NOT | *MVN* on page C6-667 |
| ORN | Bitwise inclusive OR NOT | *ORN (shifted register)* on page C6-676 |
| TST | Test bits | *TST (shifted register)* on page C6-815 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C3.4.5 Move (register)

The Move (register) instructions are aliases for other data processing instructions. They copy a value from a general-purpose register to another general-purpose register or the current stack pointer, or from the current stack pointer to a general-purpose register.

**Table C3-40 MOV register instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| MOV | • Move register<br>• Move register to SP or move SP to register | • *MOV (register)* on page C6-653<br>• *MOV (to/from SP)* on page C6-649 |

### C3.4.6 Shift (register)

In the Shift (register) instructions, the shift amount is the positive value in the second source register modulo the register size. The register width of the instruction controls whether the new bits are fed into the result on a right shift or rotate at bit[63] or bit[31].

Table C3-41 shows the Shift (register) instructions.

**Table C3-41 Shift (register) instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ASRV | Arithmetic shift right variable | *ASRV* on page C6-460 |
| LSLV | Logical shift left variable | *LSLV* on page C6-642 |
| LSRV | Logical shift right variable | *LSRV* on page C6-645 |
| RORV | Rotate right variable | *RORV* on page C6-704 |

However, the Shift (register) instructions have a preferred set of aliases that match the shift immediate aliases described in *Shift (immediate)* on page C3-156.

Table C3-42 shows the aliases for Shift (register) instructions.

**Table C3-42 Aliases for Variable shift instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ASR | Arithmetic shift right | *ASR (register)* on page C6-458 |
| LSL | Logical shift left | *LSL (register)* on page C6-640 |
| LSR | Logical shift right | *LSR (register)* on page C6-643 |
| ROR | Rotate right | *ROR (register)* on page C6-703 |

### C3.4.7 Multiply and divide

This section describes the instructions used for integer multiplication and division. It contains the following subsections:

- *Multiply* on page C3-162.
- *Divide* on page C3-162.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Multiply

The Multiply instructions write to a single 32-bit or 64-bit destination register, and are built around the fundamental four operand multiply-add and multiply-subtract operation, together with 32-bit to 64-bit widening variants. A 64-bit to 128-bit widening multiple can be constructed with two instructions, using `SMULH` or `UMULH` to generate the upper 64 bits. Table C3-43 shows the Multiply instructions.

**Table C3-43 Multiply integer instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| `MADD` | Multiply-add | *MADD* on page C6-646 |
| `MSUB` | Multiply-subtract | *MSUB* on page C6-664 |
| `MNEG` | Multiply-negate | *MNEG* on page C6-648 |
| `MUL` | Multiply | *MUL* on page C6-666 |
| `SMADDL` | Signed multiply-add long | *SMADDL* on page C6-716 |
| `SMSUBL` | Signed multiply-subtract long | *SMSUBL* on page C6-720 |
| `SMNEGL` | Signed multiply-negate long | *SMNEGL* on page C6-719 |
| `SMULL` | Signed multiply long | *SMULL* on page C6-723 |
| `SMULH` | Signed multiply high | *SMULH* on page C6-722 |
| `UMADDL` | Unsigned multiply-add long | *UMADDL* on page C6-822 |
| `UMSUBL` | Unsigned multiply-subtract long | *UMSUBL* on page C6-825 |
| `UMNEGL` | Unsigned multiply-negate long | *UMNEGL* on page C6-824 |
| `UMULL` | Unsigned multiply long | *UMULL* on page C6-828 |
| `UMULH` | Unsigned multiply high | *UMULH* on page C6-827 |

### Divide

The Divide instructions compute the quotient of a division, rounded towards zero. The remainder can then be computed as (numerator - (quotient × denominator)), using the `MSUB` instruction.

If a signed integer division (`INT_MIN / -1`) is performed where `INT_MIN` is the most negative integer value representable in the selected register size, then the result overflows the signed integer range. No indication of this overflow is produced and the result that is written to the destination register is `INT_MIN`.

A division by zero results in a zero being written to the destination register, without any indication that the division by zero occurred.

Table C3-44 shows the Divide instructions.

**Table C3-44 Divide instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| `SDIV` | Signed divide | *SDIV* on page C6-713 |
| `UDIV` | Unsigned divide | *UDIV* on page C6-821 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C3.4.8 CRC32

The optional CRC32 instructions operate on the general-purpose register file to update a 32-bit CRC value from an input value comprising 1, 2, 4, or 8 bytes. There are two different classes of CRC instructions, CRC32 and CRC32C, that support two commonly used 32-bit polynomials, known as CRC-32 and CRC-32C.

To fit with common usage, the bit order of the values is reversed as part of the operation.

When bits[19:16] of ID_AA64ISAR0_EL1 are set to 0b0001 the CRC instructions are implemented.

Table C3-45 shows the CRC instructions.

**Table C3-45 CRC32 instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| CRC32B | CRC-32 sum from byte | *CRC32B, CRC32H, CRC32W, CRC32X* on page C6-498 |
| CRC32H | CRC-32 sum from halfword | *CRC32B, CRC32H, CRC32W, CRC32X* on page C6-498 |
| CRC32W | CRC-32 sum from word | *CRC32B, CRC32H, CRC32W, CRC32X* on page C6-498 |
| CRC32X | CRC-32 sum from doubleword | *CRC32B, CRC32H, CRC32W, CRC32X* on page C6-498 |
| CRC32CB | CRC-32C sum from byte | *CRC32CB, CRC32CH, CRC32CW, CRC32CX* on page C6-500 |
| CRC32CH | CRC-32C sum from halfword | *CRC32CB, CRC32CH, CRC32CW, CRC32CX* on page C6-500 |
| CRC32CW | CRC-32C sum from word | *CRC32CB, CRC32CH, CRC32CW, CRC32CX* on page C6-500 |
| CRC32CX | CRC-32C sum from doubleword | *CRC32CB, CRC32CH, CRC32CW, CRC32CX* on page C6-500 |

### C3.4.9 Bit operation

Table C3-46 shows the Bit operation instructions.

**Table C3-46 Bit operation instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| CLS | Count leading sign bits | *CLS* on page C6-485 |
| CLZ | Count leading zero bits | *CLZ* on page C6-486 |
| RBIT | Reverse bit order | *RBIT* on page C6-693 |
| REV | Reverse bytes in register | *REV* on page C6-696 |
| REV16 | Reverse bytes in halfwords | *REV16* on page C6-698 |
| REV32 | Reverses bytes in words | *REV32* on page C6-700 |

### C3.4.10 Conditional select

The Conditional select instructions select between the first or second source register, depending on the current state of the condition flags. When the named condition is true, the first source register is selected and its value is copied without modification to the destination register. When the condition is false the second source register is selected and its value might not be optionally inverted, negated, or incremented by one, before writing to the destination register.

Other useful conditional set and conditional unary operations are implemented as aliases of the four Conditional select instructions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Table C3-47 shows the Conditional select instructions.

**Table C3-47 Conditional select instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| CSEL | Conditional select | *CSEL* on page C6-502 |
| CSINC | Conditional select increment | *CSINC* on page C6-505 |
| CSINV | Conditional select inversion | *CSINV* on page C6-507 |
| CSNEG | Conditional select negation | *CSNEG* on page C6-509 |
| CSET | Conditional set | *CSET* on page C6-503 |
| CSETM | Conditional set mask | *CSETM* on page C6-504 |
| CINC | Conditional increment | *CINC* on page C6-482 |
| CINV | Conditional invert | *CINV* on page C6-483 |
| CNEG | Conditional negate | *CNEG* on page C6-497 |

### C3.4.11 Conditional comparison

The Conditional comparison instructions provide a conditional select for the NZCV condition flags, setting the flags to the result of an arithmetic comparison of its two source register values if the named input condition is true, or to an immediate value if the input condition is false. There are register and immediate forms. The immediate form compares the source register to a small 5-bit unsigned value.

Table C3-48 shows the Conditional comparison instructions.

**Table C3-48 Conditional comparison instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| CCMN | Conditional compare negative (register) | *CCMN (register)* on page C6-479 |
| CCMN | Conditional compare negative (immediate) | *CCMN (immediate)* on page C6-478 |
| CCMP | Conditional compare (register) | *CCMP (register)* on page C6-481 |
| CCMP | Conditional compare (immediate) | *CCMP (immediate)* on page C6-480 |

## C3.5 Data processing - SIMD and floating-point

This section describes the instruction groups for data processing with SIMD and floating-point register operands.

It contains the following subsections that describe the scalar floating-point data processing instructions:

- *Floating-point move (register)* on page C3-166.
- *Floating-point move (immediate)* on page C3-166.
- *Floating-point conversion* on page C3-167.
- *Floating-point round to integral* on page C3-168.
- *Floating-point multiply-add* on page C3-169.
- *Floating-point arithmetic (one source)* on page C3-169.
- *Floating-point arithmetic (two sources)* on page C3-169.
- *Floating-point minimum and maximum* on page C3-169.
- *Floating-point comparison* on page C3-170.
- *Floating-point conditional select* on page C3-170.

It also contains the following subsections that describe the SIMD data processing instructions:

- *SIMD move* on page C3-171
- *SIMD arithmetic* on page C3-171.
- *SIMD compare* on page C3-173.
- *SIMD widening and narrowing arithmetic* on page C3-174.
- *SIMD unary arithmetic* on page C3-175.
- *SIMD by element arithmetic* on page C3-177.
- *SIMD permute* on page C3-178.
- *SIMD immediate* on page C3-178.
- *SIMD shift (immediate)* on page C3-179.
- *SIMD floating-point and integer conversion* on page C3-180.
- *SIMD reduce (across vector lanes)* on page C3-181.
- *SIMD pairwise arithmetic* on page C3-181.
- *SIMD table lookup* on page C3-182.
- *The Cryptographic Extensions* on page C3-182.

For information about the encoding structure of the instructions in this instruction group, see *Data processing - SIMD and floating point* on page C4-227.

For information about the floating-point exceptions, see *Floating-point exception traps* on page D1-1568.

### C3.5.1 Common features of SIMD instructions

A number of SIMD instructions come in three forms:

- Wide:
  - This is indicated by the suffix *W*. The element width of the destination register and the first source operand is double that of the second source operand.
- Long:
  - This is indicated by the suffix *L*. The element width of the destination register is double that of both source operands.
- Narrow:
  - This is indicated by the suffix *N*. The element width of the destination register is half that of both source operands.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Furthermore, each vector form of the instruction is part of a pair, with a second and upper half suffix of *2*, to identify the variant of the instruction:

- Where a SIMD operation widens or lengthens a 64-bit vector to a 128-bit vector, the instruction provides a second part operation that can extract the source from the upper 64 bits of the source registers.
- Where a SIMD operation narrows a 128-bit vector to a 64-bit vector, the instruction provides a second-part operation that can pack the result of a second operation into the upper part of the same destination register.

**Note**

This is referred to as a *lane set specifier*.

### C3.5.2 Floating-point move (register)

The Floating-point move (register) instructions copy a scalar floating-point value from one register to another register without performing any conversion.

Some of the Floating-point move (register) instructions overlap with the functionality provided by the Advanced SIMD instructions `DUP`, `INS`, and `UMOV`. However, ARM recommends using the `FMOV` instructions when operating on scalar floating-point data to avoid the creation of scalar floating-point code that depends on the availability of the Advanced SIMD instruction set.

Table C3-49 shows the Floating-point move (register) instructions.

**Table C3-49 Floating-point move (register) instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| `FMOV` | • Floating-point move register without conversion<br>• Floating-point move to or from general-purpose register without conversion | • *FMOV (register)* on page C7-1032<br>• *FMOV (general)* on page C7-1034 |

### C3.5.3 Floating-point move (immediate)

The Floating-point move (immediate) instructions convert a small constant immediate floating-point value into a single-precision or double-precision scalar floating-point value in a SIMD and floating-point register.

The floating-point constant can be specified either in decimal notation, such as 12.0 or -1.2e1, or as a string beginning with `0x` followed by a hexadecimal representation of the IEEE 754 single-precision or double-precision encoding. ARM recommends that a disassembler uses the decimal notation, provided that this displays the value precisely.

The floating-point value must be expressible as $(\pm n/16 \times 2^r)$, where $n$ is an integer in the range $16 \le n \le 31$ and $r$ is an integer in the range of $-3 \le r \le 4$, that is a normalized binary floating-point encoding with one sign bit, four bits of fraction, and a 3-bit exponent.

**Note**

This encoding does not include the floating-point constant 0.0. There are several instructions that can store zero in a SIMD and floating-point register, but ARM recommends that software uses `FMOV Sd, WZR` or `FMOV Dd, XZR` to provide consistency across a range of microarchitectures.

Table C3-50 shows the Floating-point move (immediate) instruction:

**Table C3-50 Floating-point move (immediate) instruction**

### C3.5.4 Floating-point conversion

The following subsections describe the conversion of floating-point values:

- *Convert floating-point precision*.
- *Convert between floating-point and integer or fixed-point*.

#### Convert floating-point precision

These instructions convert a floating-point scalar with one precision to a floating-point scalar with a different precision, using the current rounding mode as specified by FPCR.RMode.

Table C3-51 shows the Floating-point precision conversion instruction.

**Table C3-51 Floating-point precision conversion instruction**

| Mnemonic | Instruction | See |
|---|---|---|
| FCVT | Floating-point convert precision (scalar) | *FCVT* on page C7-934 |

#### Convert between floating-point and integer or fixed-point

These instructions convert a floating-point scalar in a SIMD and floating-point register to or from a signed or unsigned integer or fixed-point in a general-purpose register. For a fixed-point value, a final immediate operand indicates that the general-purpose register holds a fixed-point number and `fbits` indicates the number of bits after the binary point. `fbits` is in the range 1- 32 inclusive for a 32-bit general-purpose register name, and 1-64 inclusive for a 64-bit general-purpose register name.

These instructions generate the Invalid Operation exception, in response to a floating-point input of NaN, infinity, or a numerical value that cannot be represented within the destination register. An out-of-range integer or fixed-point result is saturated to the size of the destination register. A numeric result that differs from the input generates an Inexact exception. When flush-to-zero mode is enabled, zero replaces a denormal input and generates an Input Denormal exception.

Table C3-52 shows the Floating-point and fixed-point conversion instructions.

**Table C3-52 Floating-point and integer or fixed-point conversion instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| FCVTAS | Floating-point scalar convert to signed integer, rounding to nearest with ties to away (scalar form) | *FCVTAS (scalar)* on page C7-938 |

### C3.5.5 Floating-point round to integral

The Floating-point round to integral instructions round a floating-point value to an integral floating-point value of the same size.

These instructions generate the Invalid Operation exception in response to a signaling NaN input, or the Input Denormal exception in response to a denormal input when flush-to-zero mode is enabled. The FRINTX instruction can also generate the Inexact exception if the result is numeric and does not have the same numerical value as the input. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as in normal floating-point arithmetic.

Table C3-53 shows the Floating-point round to integral instructions.

**Table C3-53 Floating-point round to integral instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| FRINTA | Floating-point round to integral, to nearest with ties to away | *FRINTA (scalar)* on page C7-1062 |
| FRINTI | Floating-point round to integral, using current rounding mode | *FRINTI (scalar)* on page C7-1064 |
| FRINTM | Floating-point round to integral, toward minus infinity | *FRINTM (scalar)* on page C7-1066 |

| FNMADD | Floating-point scalar negated fused multiply-add | *FNMADD* on page C7-1051 |
| FNMSUB | Floating-point scalar negated fused multiply-subtract | *FNMSUB* on page C7-1053 |

### C3.5.7 Floating-point arithmetic (one source)

Table C3-55 shows the Floating-point arithmetic instructions that require a single source register operand.

**Table C3-55 Floating-point arithmetic instructions with one source register**

| Mnemonic | Instructions | See |
|---|---|---|
| FABS | Floating-point scalar absolute value | *FABS (scalar)* on page C7-899 |
| FNEG | Floating-point scalar negate | *FNEG (scalar)* on page C7-1049 |
| FSQRT | Floating-point scalar square root | *FSQRT (scalar)* on page C7-1080 |

### C3.5.8 Floating-point arithmetic (two sources)

Table C3-56 shows the Floating-point arithmetic instructions that require two source register operands.

**Table C3-56 Floating-point arithmetic instructions with two source registers**

| Mnemonic | Instruction | See |
|---|---|---|
| FADD | Floating-point scalar add | *FADD (scalar)* on page C7-906 |
| FDIV | Floating-point scalar divide | *FDIV (scalar)* on page C7-989 |
| FMUL | Floating-point scalar multiply | *FMUL (scalar)* on page C7-1043 |
| FNMUL | Floating-point scalar multiply-negate | *FNMUL* on page C7-1055 |
| FSUB | Floating-point scalar subtract | *FSUB (scalar)* on page C7-1083 |

### C3.5.9 Floating-point minimum and maximum

The `min(x,y)` and `max(x,y)` operations return a quiet NaN when either *x* or *y* is NaN. In flush-to-zero mode denormal operands are flushed to zero before comparison, and if the result of the comparison is the flushed value, then a zero value is returned. Where both *x* and *y* are zero, or denormal values flushed to zero, with different signs, then +0.0 is returned by `max()` and -0.0 by `min()`.

The `minNum(x,y)` and `maxNum(x,y)` operations follow the IEEE 754-2008 standard and return the numerical operand when one operand is numerical and the other a quiet NaN. Apart from this additional handling of a single quiet NaN the result is then identical to `min(x,y)` and `max(x,y)`.

Table C3-57 on page C3-170 shows the Floating-point instructions that can perform floating-point minimum and maximum operations.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table C3-57 Floating-point minimum and maximum instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| FMAX | Floating-point scalar maximum | *FMAX (scalar)* on page C7-994 |
| FMAXNM | Floating-point scalar maximum number | *FMAXNM (scalar)* on page C7-998 |
| FMIN | Floating-point scalar minimum | *FMIN (scalar)* on page C7-1010 |
| FMINNM | Floating-point scalar minimum number | *FMINNM (scalar)* on page C7-1014 |

### C3.5.10 Floating-point comparison

These instructions set the NZCV condition flags in PSTATE, based on the result of a comparison of two operands. If the floating-point comparisons are *unordered*, where one or both operands are a form of NaN, the C and V bits are set to 1 and the N and Z bits are cleared to 0.

**Note**

The NZCV flags in the FPSR are associated with AArch32 state. The A64 floating-point comparison instructions do not change the condition flags in the FPSR.

For the conditional Floating-point comparison instructions, if the condition is TRUE, the flags are updated to the result of the comparison, otherwise the flags are updated to the immediate value that is defined in the instruction encoding.

The quiet compare instructions generate an Invalid Operation exception if either of the source operands is a signaling NaN. The signaling compare instructions generate an Invalid Operation exception if either of the source operands is any type of NaN.

Table C3-58 shows the Floating-point comparison instructions.

**Table C3-58 Floating-point comparison instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| FCMP | Floating-point quiet compare | *FCMP* on page C7-929 |
| FCMPE | Floating-point signaling compare | *FCMPE* on page C7-931 |
| FCCMP | Floating-point conditional quiet compare | *FCCMP* on page C7-909 |
| FCCMPE | Floating-point conditional signaling compare | *FCCMPE* on page C7-911 |

### C3.5.11 Floating-point conditional select

Table C3-59 shows the Floating-point conditional select instructions.

**Table C3-59 Floating-point conditional select instructions**

### C3.5.14 SIMD compare

The SIMD compare instructions compare vector or scalar elements according to the specified condition and set the destination vector element to all ones if the condition holds, or to zero if the condition does not hold.

**Note**

Some of the comparisons, such as LS, LE, LO, and LT, can be made by reversing the operands and using the opposite comparison, HS, GE, HI, or GT.

Table C3-62 shows that SIMD compare instructions.

**Table C3-62 SIMD compare instructions**

### C3.5.15 SIMD widening and narrowing arithmetic

For information about the variants of these instructions, see *Common features of SIMD instructions* on page C3-165.

Table C3-63 shows the SIMD widening and narrowing arithmetic instructions.

**Table C3-63 SIMD widening and narrowing arithmetic instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ADDHN, ADDHN2 | Add returning high, narrow (vector form) | *ADDHN, ADDHN2* on page C7-844 |
| PMULL, PMULL2 | Polynomial multiply long (vector form) | *PMULL, PMULL2* on page C7-1179<br>See also *The Cryptographic Extensions* on page C3-182 |
| RADDHN, RADDHN2 | Rounding add returning high, narrow (vector form) | *RADDHN, RADDHN2* on page C7-1181 |
| RSUBHN, RSUBHN2 | Rounding subtract returning high, narrow (vector form) | *RSUBHN, RSUBHN2* on page C7-1192 |
| SABAL, SABAL2 | Signed absolute difference and accumulate long (vector form) | *SABAL, SABAL2* on page C7-1196 |
| SABDL, SABDL2 | Signed absolute difference long (vector form) | *SABDL, SABDL2* on page C7-1200 |
| SADDL, SADDL2 | Signed add long (vector form) | *SADDL, SADDL2* on page C7-1204 |
| SADDW, SADDW2 | Signed add wide (vector form) | *SADDW, SADDW2* on page C7-1210 |
| SMLAL, SMLAL2 | Signed multiply-add long (vector form) | *SMLAL, SMLAL2 (vector)* on page C7-1254 |

**Table C3-63 SIMD widening and narrowing arithmetic instructions (continued)**

| Mnemonic | Instruction | See |
|---|---|---|
| SMLSL, SMLSL2 | Signed multiply-subtract long (vector form) | *SMLSL, SMLSL2 (vector)* on page C7-1258 |
| SMULL, SMULL2 | Signed multiply long (vector form) | *SMULL, SMULL2 (vector)* on page C7-1264 |
| SQDMLAL, SQDMLAL2 | Signed saturating doubling multiply-add long (vector and scalar form) | *SQDMLAL, SQDMLAL2 (vector)* on page C7-1273 |
| SQDMLSL, SQDMLSL2 | Signed saturating doubling multiply-subtract long (vector and scalar form) | *SQDMLSL, SQDMLSL2 (vector)* on page C7-1279 |
| SQDMULL, SQDMULL2 | Signed saturating doubling multiply long (vector and scalar form) | *SQDMULL, SQDMULL2 (vector)* on page C7-1290 |
| SSUBL, SSUBL2 | Signed subtract long (vector form) | *SSUBL, SSUBL2* on page C7-1345 |
| SSUBW, SSUBW2 | Signed subtract wide (vector form) | *SSUBW, SSUBW2* on page C7-1347 |
| SUBHN, SUBHN2 | Subtract returning high, narrow (vector form) | *SUBHN, SUBHN2* on page C7-1393 |
| UABAL, UABAL2 | Unsigned absolute difference and accumulate long (vector form) | *UABAL, UABAL2* on page C7-1407 |
| UABDL, UABDL2 | Unsigned absolute difference long (vector form) | *UABDL, UABDL2* on page C7-1411 |
| UADDL, UADDL2 | Unsigned add long (vector form) | *UADDL, UADDL2* on page C7-1415 |
| UADDW, UADDW2 | Unsigned add wide (vector form) | *UADDW, UADDW2* on page C7-1421 |
| UMLAL, UMLAL2 | Unsigned multiply-add long (vector form) | *UMLAL, UMLAL2 (vector)* on page C7-1447 |
| UMLSL, UMLSL2 | Unsigned multiply-subtract long (vector form) | *UMLSL, UMLSL2 (vector)* on page C7-1451 |
| UMULL, UMULL2 | Unsigned multiply long (vector form) | *UMULL, UMULL2 (vector)* on page C7-1457 |
| USUBL, USUBL2 | Unsigned subtract long (vector form) | *USUBL, USUBL2* on page C7-1497 |
| USUBW, USUBW2 | Unsigned subtract wide (vector form) | *USUBW, USUBW2* on page C7-1499 |

### C3.5.16 SIMD unary arithmetic

For information about the variants of these instructions, see *Common features of SIMD instructions* on page C3-165.

Table C3-64 shows the SIMD unary arithmetic instructions.

**Table C3-64 SIMD unary arithmetic instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ABS | Absolute value (vector and scalar form) | *ABS* on page C7-840 |
| CLS | Count leading sign bits (vector form) | *CLS (vector)* on page C7-863 |
| CLZ | Count leading zero bits (vector form) | *CLZ (vector)* on page C7-864 |
| CNT | Population count per byte (vector form) | *CNT* on page C7-887 |
| FABS | Floating-point absolute (vector form) | *FABS (vector)* on page C7-898 |
| FCVTL, FCVTL2 | Floating-point convert to higher precision long (vector form) | *FCVTL, FCVTL2* on page C7-944 |
| FCVTN, FCVTN2 | Floating-point convert to lower precision narrow (vector form) | *FCVTN, FCVTN2* on page C7-953 |

**Table C3-64 SIMD unary arithmetic instructions (continued)**

| Mnemonic | Instruction | See |
|---|---|---|
| FCVTXN, FCVTXN2 | Floating-point convert to lower precision narrow, rounding to odd (vector and scalar form) | *FCVTXN, FCVTXN2* on page C7-970 |
| FNEG | Floating-point negate (vector form) | *FNEG (vector)* on page C7-1048 |
| FRECPE | Floating-point reciprocal estimate (vector and scalar form) | *FRECPE* on page C7-1056 |
| FRECPX | Floating-point reciprocal square root (scalar form) | *FRECPX* on page C7-1060 |
| FRINTA | Floating-point round to integral, to nearest with ties to away (vector form) | *FRINTA (scalar)* on page C7-1062 |
| FRINTI | Floating-point round to integral, using current rounding mode (vector form) | *FRINTI (vector)* on page C7-1063 |
| FRINTM | Floating-point round to integral, toward minus infinity (vector form) | *FRINTM (vector)* on page C7-1065 |
| FRINTN | Floating-point round to integral, to nearest with ties to even (vector form) | *FRINTN (vector)* on page C7-1067 |
| FRINTP | Floating-point round to integral, toward positive infinity (vector form) | *FRINTP (vector)* on page C7-1069 |
| FRINTX | Floating-point round to integral exact, using current rounding mode (vector form) | *FRINTX (vector)* on page C7-1071 |
| FRINTZ | Floating-point round to integral, toward zero (vector form) | *FRINTZ (vector)* on page C7-1073 |
| FRSQRTE | Floating-point reciprocal square root estimate (vector and scalar form) | *FRSQRTE* on page C7-1075 |
| FSQRT | Floating-point square root (vector form) | *FSQRT (vector)* on page C7-1079 |
| MVN | Bitwise NOT (vector form) | *MVN* on page C7-1166 |
| NEG | Negate (vector and scalar form) | *NEG (vector)* on page C7-1169 |
| NOT | Bitwise NOT (vector form) | *NOT* on page C7-1171 |
| RBIT | Bitwise reverse (vector form) | *RBIT (vector)* on page C7-1183 |
| REV16 | Reverse elements in 16-bit halfwords (vector form) | *REV16 (vector)* on page C7-1184 |
| REV32 | Reverse elements in 32-bit words (vector form) | *REV32 (vector)* on page C7-1186 |
| REV64 | Reverse elements in 64-bit doublewords (vector form) | *REV64* on page C7-1188 |
| SADALP | Signed add and accumulate long pairwise (vector form) | *SADALP* on page C7-1202 |
| SADDLP | Signed add long pairwise (vector form) | *SADDLP* on page C7-1206 |
| SQABS | Signed saturating absolute value (vector and scalar form) | *SQABS* on page C7-1266 |
| SQNEG | Signed saturating negate (vector and scalar form) | *SQNEG* on page C7-1293 |
| SQXTN, SQXTN2 | Signed saturating extract narrow (vector form) | *SQXTN, SQXTN2* on page C7-1324 |
| SQXTUN, SQXTUN2 | Signed saturating extract unsigned narrow (vector and scalar form) | *SQXTUN, SQXTUN2* on page C7-1326 |
| SUQADD | Signed saturating accumulate of unsigned value (vector and scalar form) | *SUQADD* on page C7-1395 |

| SQDMULL, SQDMULL2 | Signed saturating doubling multiply long (vector and scalar form) | *SQDMULL, SQDMULL2 (by element)* on page C7-1287 |
| SQRDMULH | Signed saturating rounding doubling multiply returning high half (vector and scalar form) | *SQRDMULH (by element)* on page C7-1295 |
| UMLAL, UMLAL2 | Unsigned multiply-add long (vector form) | *UMLAL, UMLAL2 (by element)* on page C7-1445 |
| UMLSL, UMLSL2 | Unsigned multiply-subtract long (vector form) | *UMLSL, UMLSL2 (by element)* on page C7-1449 |
| UMULL, UMULL2 | Unsigned multiply long (vector form) | *UMULL, UMULL2 (by element)* on page C7-1455 |

### C3.5.18 SIMD permute

Table C3-66 shows the SIMD permute instructions.

**Table C3-66 SIMD permute instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| EXT | Extract vector from a pair of vectors | *EXT* on page C7-895 |
| TRN1 | Transpose vectors (primary) | *TRN1* on page C7-1403 |
| TRN2 | Transpose vectors (secondary) | *TRN2* on page C7-1404 |
| UZP1 | Unzip vectors (primary) | *UZP1* on page C7-1503 |
| UZP2 | Unzip vectors (secondary) | *UZP2* on page C7-1504 |
| ZIP1 | Zip vectors (primary) | *ZIP1* on page C7-1507 |
| ZIP2 | Zip vectors (secondary) | *ZIP2* on page C7-1509 |

### C3.5.19 SIMD immediate

Table C3-67 shows the SIMD immediate instructions.

**Table C3-67 SIMD immediate instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| BIC | Bitwise bit clear immediate | *BIC (vector, immediate)* on page C7-854 |
| FMOV | Floating-point move immediate | *FMOV (vector, immediate)* on page C7-1030 |
| MOVI | Move immediate | *MOVI* on page C7-1159 |
| MVNI | Move inverted immediate | *MVNI* on page C7-1167 |
| ORR | Bitwise inclusive OR immediate | *ORR (vector, immediate)* on page C7-1173 |

### C3.5.20 SIMD shift (immediate)

For information about the variants of these instructions, see *Common features of SIMD instructions* on page C3-165.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Table C3-68 shows the SIMD shift immediate instructions.

**Table C3-68 SIMD shift (immediate) instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| RSHRN, RSHRN2 | Rounding shift right narrow immediate (vector form) | *RSHRN, RSHRN2* on page C7-1190 |
| SHL | Shift left immediate (vector and scalar form) | *SHL* on page C7-1231 |
| SHLL, SHLL2 | Shift left long (by element size) (vector form) | *SHLL, SHLL2* on page C7-1233 |
| SHRN, SHRN2 | Shift right narrow immediate (vector form) | *SHRN, SHRN2* on page C7-1235 |
| SLI | Shift left and insert immediate (vector and scalar form) | *SLI* on page C7-1238 |
| SQRSHRN, SQRSHRN2 | Signed saturating rounded shift right narrow immediate (vector and scalar form) | *SQRSHRN, SQRSHRN2* on page C7-1302 |
| SQRSHRUN, SQRSHRUN2 | Signed saturating shift right unsigned narrow immediate (vector and scalar form) | *SQRSHRUN, SQRSHRUN2* on page C7-1305 |
| SQSHL | Signed saturating shift left immediate (vector and scalar form) | *SQSHL (immediate)* on page C7-1308 |
| SQSHLU | Signed saturating shift left unsigned immediate (vector and scalar form) | *SQSHLU* on page C7-1313 |
| SQSHRN, SQSHRN2 | Signed saturating shift right narrow immediate (vector and scalar form) | *SQSHRN, SQSHRN2* on page C7-1316 |
| SQSHRUN, SQSHRUN2 | Signed saturating shift right unsigned narrow immediate (vector and scalar form) | *SQSHRUN, SQSHRUN2* on page C7-1319 |
| SRI | Shift right and insert immediate (vector and scalar form) | *SRI* on page C7-1329 |
| SRSHR | Signed rounding shift right immediate (vector and scalar form) | *SRSHR* on page C7-1333 |
| SRSRA | Signed rounding shift right and accumulate immediate (vector and scalar form) | *SRSRA* on page C7-1335. |
| SSHLL, SSHLL2 | Signed shift left long immediate (vector form) | *SSHLL, SSHLL2* on page C7-1339 |
| SSHR | Signed shift right immediate (vector and scalar form) | *SSHR* on page C7-1341 |
| SSRA | Signed integer shift right and accumulate immediate (vector and scalar form) | *SSRA* on page C7-1343 |
| SXTL, SXTL2 | Signed integer extend (vector only) | *SXTL, SXTL2* on page C7-1397 |
| UQRSHRN, UQRSHRN2 | Unsigned saturating rounded shift right narrow immediate (vector and scalar form) | *UQRSHRN, UQRSHRN2* on page C7-1463 |
| UQSHL | Unsigned saturating shift left immediate (vector and scalar form) | *UQSHL (immediate)* on page C7-1466 |
| UQSHRN, UQSHRN2 | Unsigned saturating shift right narrow immediate (vector and scalar form) | *UQSHRN, UQSHRN2* on page C7-1471 |
| URSHR | Unsigned rounding shift right immediate (vector and scalar form) | *URSHR* on page C7-1482 |
| URSRA | Unsigned integer rounding shift right and accumulate immediate (vector and scalar form) | *URSRA* on page C7-1485 |
| USHLL, USHLL2 | Unsigned shift left long immediate (vector form) | *USHLL, USHLL2* on page C7-1489 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

**Table C3-68 SIMD shift (immediate) instructions (continued)**

| Mnemonic | Instruction | See |
|---|---|---|
| USHR | Unsigned shift right immediate (vector and scalar form) | *USHR* on page C7-1491 |
| USRA | Unsigned shift right and accumulate immediate (vector and scalar form) | *USRA* on page C7-1495 |
| UXTL, UXTL2 | Unsigned integer extend (vector only) | *UXTL, UXTL2* on page C7-1501 |

### C3.5.21 SIMD floating-point and integer conversion

The SIMD floating-point and integer conversion instructions generate the Invalid Operation exception in response to a floating-point input of NaN, infinity, or a numerical value that cannot be represented within the destination register. An out-of-range integer or a fixed-point result is saturated to the size of the destination register. A numeric result that differs from the input raises the Inexact exception.

Table C3-69 shows the SIMD floating-point and integer conversion instructions.

**Table C3-69 SIMD floating-point and integer conversion instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| FCVTAS | Floating-point convert to signed integer, rounding to nearest with ties to away (vector and scalar form) | *FCVTAS (vector)* on page C7-936 |
| FCVTAU | Floating-point convert to unsigned integer, rounding to nearest with ties to away (vector and scalar form) | *FCVTAU (vector)* on page C7-940 |
| FCVTMS | Floating-point convert to signed integer, rounding toward minus infinity (vector and scalar form) | *FCVTMS (vector)* on page C7-945 |
| FCVTMU | Floating-point convert to unsigned integer, rounding toward minus infinity (vector and scalar form) | *FCVTMU (vector)* on page C7-949 |
| FCVTNS | Floating-point convert to signed integer, rounding to nearest with ties to even (vector and scalar form) | *FCVTNS (vector)* on page C7-954 |
| FCVTNU | Floating-point convert to unsigned integer, rounding to nearest with ties to even (vector and scalar form) | *FCVTNU (vector)* on page C7-958 |
| FCVTPS | Floating-point convert to signed integer, rounding toward positive infinity (vector and scalar form) | *FCVTPS (vector)* on page C7-962 |
| FCVTPU | Floating-point convert to unsigned integer, rounding toward positive infinity (vector and scalar form) | *FCVTPU (vector)* on page C7-966 |
| FCVTZS | • Floating-point convert to signed integer, rounding toward zero (vector and scalar form)<br>• Floating-point convert to signed fixed-point, rounding toward zero (vector and scalar form) | • *FCVTZS (vector, integer)* on page C7-974<br>• *FCVTZS (vector, fixed-point)* on page C7-972 |

**Table C3-69 SIMD floating-point and integer conversion instructions (continued)**

| Mnemonic | Instruction | See |
|---|---|---|
| FCVTZU | • Floating-point convert to unsigned integer, rounding toward zero (vector and scalar form)<br>• Floating-point convert to unsigned fixed-point, rounding toward zero, (vector and scalar form) | • *FCVTZU (vector, integer)* on page C7-982<br>• *FCVTZU (vector, fixed-point)* on page C7-980 |
| SCVTF | • Signed integer convert to floating-point (vector and scalar form)<br>• Signed fixed-point convert to floating-point (vector and scalar form) | • *SCVTF (vector, integer)* on page C7-1214<br>• *SCVTF (vector, fixed-point)* on page C7-1212 |
| UCVTF | • Unsigned integer convert to floating-point (vector and scalar form)<br>• Unsigned fixed-point convert to floating-point (vector and scalar form) | • *UCVTF (vector, integer)* on page C7-1425<br>• *UCVTF (vector, fixed-point)* on page C7-1423 |

### C3.5.22 SIMD reduce (across vector lanes)

The SIMD reduce (across vector lanes) instructions perform arithmetic operations horizontally, that is across all lanes of the input vector. They deliver a single scalar result.

Table C3-70 shows the SIMD reduce (across vector lanes) instructions.

**Table C3-70 SIMD reduce (across vector lanes) instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ADDV | Add (across vector) | *ADDV* on page C7-848 |
| FMAXNMV | Floating-point maximum number (across vector) | *FMAXNMV* on page C7-1003 |
| FMAXV | Floating-point maximum (across vector) | *FMAXV* on page C7-1007 |
| FMINNMV | Floating-point minimum number (across vector) | *FMINNMV* on page C7-1019 |
| FMINV | Floating-point minimum (across vector) | *FMINV* on page C7-1023 |
| SADDLV | Signed add long (across vector) | *SADDLV* on page C7-1208 |
| SMAXV | Signed maximum (across vector) | *SMAXV* on page C7-1244 |
| SMINV | Signed minimum (across vector) | *SMINV* on page C7-1250 |
| UADDLV | Unsigned add long (across vector) | *UADDLV* on page C7-1419 |
| UMAXV | Unsigned maximum (across vector) | *UMAXV* on page C7-1437 |
| UMINV | Unsigned minimum (across vector) | *UMINV* on page C7-1443 |

### C3.5.23 SIMD pairwise arithmetic

The SIMD pairwise arithmetic instructions perform operations on pairs of adjacent elements and deliver a vector result.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Table C3-71 shows the SIMD pairwise arithmetic instructions.

**Table C3-71 SIMD pairwise arithmetic instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| ADDP | Add pairwise (vector and scalar form) | • *ADDP (vector)* on page C7-847<br>• *ADDP (scalar)* on page C7-846 |
| FADDP | Floating-point add pairwise (vector and scalar form) | • *FADDP (vector)* on page C7-908<br>• *FADDP (scalar)* on page C7-907 |
| FMAXNMP | Floating-point maximum number pairwise (vector and scalar form) | • *FMAXNMP (vector)* on page C7-1001<br>• *FMAXNMP (scalar)* on page C7-1000 |
| FMAXP | Floating-point maximum pairwise (vector and scalar form) | • *FMAXP (vector)* on page C7-1005<br>• *FMAXP (scalar)* on page C7-1004 |
| FMINNMP | Floating-point minimum number pairwise (vector and scalar form) | • *FMINNMP (vector)* on page C7-1017<br>• *FMINNMP (scalar)* on page C7-1016 |
| FMINP | Floating-point minimum pairwise (vector and scalar form) | • *FMINP (vector)* on page C7-1021<br>• *FMINP (scalar)* on page C7-1020 |
| SMAXP | Signed maximum pairwise | *SMAXP* on page C7-1242 |
| SMINP | Signed minimum pairwise | *SMINP* on page C7-1248 |
| UMAXP | Unsigned maximum pairwise | *UMAXP* on page C7-1435 |
| UMINP | Unsigned minimum pairwise | *UMINP* on page C7-1441 |

### C3.5.24 SIMD table lookup

Table C3-72 shows the SIMD table lookup instructions.

**Table C3-72 SIMD table lookup instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| TBL | Table vector lookup | *TBL* on page C7-1399 |
| TBX | Table vector lookup extension | *TBX* on page C7-1401 |

### C3.5.25 The Cryptographic Extensions

The instructions provided by the optional Cryptographic Extension share the SIMD and floating-point register file. For more information see:

- *Announcing the Advanced Encryption Standard.*
- *The Galois/Counter Mode of Operation*.
- *Announcing the Secure Hash Standard.*

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Table C3-73 shows the Cryptographic Extension instructions.

**Table C3-73 Cryptographic Extension instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| AESD | AES single round decryption | *AESD* on page C7-849 |
| AESE | AES single round encryption | *AESE* on page C7-850 |
| AESIMC | AES inverse mix columns | *AESIMC* on page C7-851 |
| AESMC | AES mix columns | *AESMC* on page C7-852 |
| PMULL | Polynomial multiply long | *PMULL, PMULL2* on page C7-1179 |
| SHA1C | SHA1 hash update (choose) | *SHA1C* on page C7-1220 |
| SHA1H | SHA1 fixed rotate | *SHA1H* on page C7-1221 |
| SHA1M | SHA1 hash update (majority) | *SHA1M* on page C7-1222 |
| SHA1P | SHA1 hash update (parity) | *SHA1P* on page C7-1223 |

# Chapter C4
# A64 Instruction Set Encoding

This chapter describes the encoding of the A64 instruction set. It contains the following sections:

- *A64 instruction index by encoding* on page C4-186.
- *Data processing - immediate* on page C4-187.
- *Branches, exception generating and system instructions* on page C4-191.
- *Loads and stores* on page C4-196.
- *Data processing - register* on page C4-218.
- *Data processing - SIMD and floating point* on page C4-227.

**Note**

In the decode tables in this chapter, an entry of - for a field value means the value of the field does not affect the decoding.

## C4.1 A64 instruction index by encoding

The encoding of an A64 instruction is:

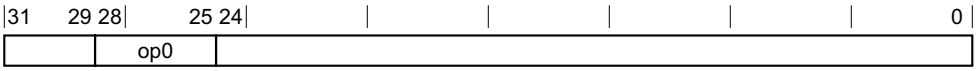

**Table C4-1 Main encoding table for the A64 instruction set**

| Decode fields<br>op0 | Decode group or instruction page |
|---|---|
| 00xx | Unallocated. |
| 100x | *Data processing - immediate* on page C4-187 |
| 101x | *Branches, exception generating and system instructions* on page C4-191 |
| x1x0 | *Loads and stores* on page C4-196 |
| x101 | *Data processing - register* on page C4-218 |
| 0111 | *Data processing - SIMD and floating point* on page C4-227 |
| 1111 | *Data processing - SIMD and floating point* on page C4-227 |

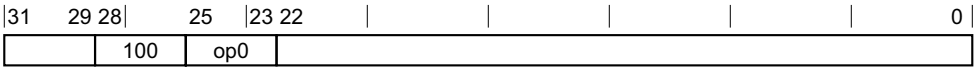
Non-Confidential - Beta

## C4.2 Data processing - immediate

This section describes the encoding of the Data processing (immediate) instruction group. This section is decoded from *A64 instruction index by encoding* on page C4-186. For additional information on this functional group of instructions, see *Data processing - immediate* on page C3-153.



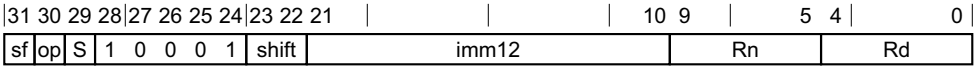


**Table C4-2 Encoding table for the Data Processing -- Immediate group**

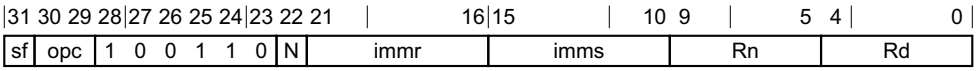
| Decode fields | Decode group or instruction page |
|---|---|
| op0 | |
| 00x | *PC-rel. addressing* on page C4-190 |
| 01x | *Add/subtract (immediate)* |
| 100 | *Logical (immediate)* on page C4-189 |
| 101 | *Move wide (immediate)* on page C4-189 |
| 110 | *Bitfield* on page C4-188 |
| 111 | *Extract* on page C4-188 |

### C4.2.1 Add/subtract (immediate)

This section describes the encoding of the Add/subtract (immediate) instruction class. This section is decoded from *Data processing - immediate*.



| Decode fields | | | | Instruction Page |
|---|---|---|---|---|
| sf | op | S | shift | |
| - | - | - | 1x | Unallocated. |
| 0 | 0 | 0 | - | ADD (immediate) - 32-bit variant |
| 0 | 0 | 1 | - | ADDS (immediate) - 32-bit variant |
| 0 | 1 | 0 | - | SUB (immediate) - 32-bit variant |
| 0 | 1 | 1 | - | SUBS (immediate) - 32-bit variant |
| 1 | 0 | 0 | - | ADD (immediate) - 64-bit variant |
| 1 | 0 | 1 | - | ADDS (immediate) - 64-bit variant |
| 1 | 1 | 0 | - | SUB (immediate) - 64-bit variant |
| 1 | 1 | 1 | - | SUBS (immediate) - 64-bit variant |

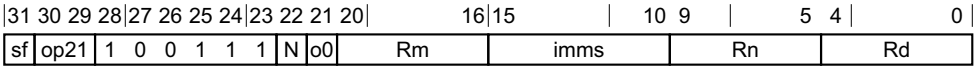
Non-Confidential - Beta

### C4.2.2 Bitfield

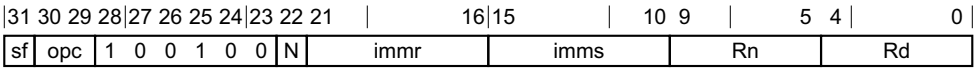


This section describes the encoding of the Bitfield instruction class. This section is decoded from *Data processing - immediate* on page C4-187.

| Decode fields | | | Instruction Page |
|---|---|---|---|
| sf | opc | N | |
| - | 11 | - | Unallocated. |
| 0 | - | 1 | Unallocated. |
| 0 | 00 | 0 | SBFM - 32-bit variant |
| 0 | 01 | 0 | BFM - 32-bit variant |
| 0 | 10 | 0 | UBFM - 32-bit variant |
| 1 | - | 0 | Unallocated. |
| 1 | 00 | 1 | SBFM - 64-bit variant |
| 1 | 01 | 1 | BFM - 64-bit variant |
| 1 | 10 | 1 | UBFM - 64-bit variant |

### C4.2.3 Extract

This section describes the encoding of the Extract instruction class. This section is decoded from *Data processing - immediate* on page C4-187.



| Decode fields | | | | | Instruction Page |
|---|---|---|---|---|---|
| sf | op21 | N | o0 | imms | |
| - | x1 | - | - | - | Unallocated. |
| - | 00 | - | 1 | - | Unallocated. |
| - | 1x | - | - | - | Unallocated. |
| 0 | - | - | - | 1xxxxx | Unallocated. |
| 0 | - | 1 | - | - | Unallocated. |
| 0 | 00 | 0 | 0 | 0xxxxx | EXTR - 32-bit variant |
| 1 | - | 0 | - | - | Unallocated. |
| 1 | 00 | 1 | 0 | - | EXTR - 64-bit variant |

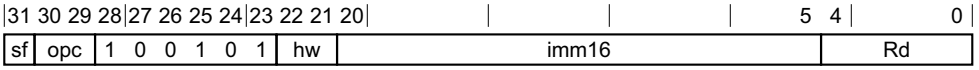
Non-Confidential - Beta

### C4.2.4 Logical (immediate)

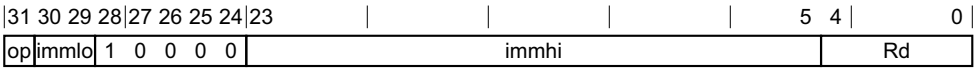


This section describes the encoding of the Logical (immediate) instruction class. This section is decoded from *Data processing - immediate* on page C4-187.

| Decode fields | | | Instruction Page |
|---|---|---|---|
| sf | opc | N | |
| 0 | - | 1 | Unallocated. |
| 0 | 00 | 0 | AND (immediate) - 32-bit variant |
| 0 | 01 | 0 | ORR (immediate) - 32-bit variant |
| 0 | 10 | 0 | EOR (immediate) - 32-bit variant |
| 0 | 11 | 0 | ANDS (immediate) - 32-bit variant |
| 1 | 00 | - | AND (immediate) - 64-bit variant |
| 1 | 01 | - | ORR (immediate) - 64-bit variant |
| 1 | 10 | - | EOR (immediate) - 64-bit variant |
| 1 | 11 | - | ANDS (immediate) - 64-bit variant |

### C4.2.5 Move wide (immediate)

This section describes the encoding of the Move wide (immediate) instruction class. This section is decoded from *Data processing - immediate* on page C4-187.



| Decode fields | | | Instruction Page |
|---|---|---|---|
| sf | opc | hw | |
| - | 01 | - | Unallocated. |
| 0 | - | 1x | Unallocated. |
| 0 | 00 | - | MOVN - 32-bit variant |
| 0 | 10 | - | MOVZ - 32-bit variant |
| 0 | 11 | - | MOVK - 32-bit variant |
| 1 | 00 | - | MOVN - 64-bit variant |
| 1 | 10 | - | MOVZ - 64-bit variant |
| 1 | 11 | - | MOVK - 64-bit variant |

Non-Confidential - Beta

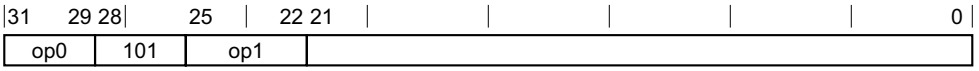
## C4.3 Branches, exception generating and system instructions

This section describes the encoding of the Branch, exception generation and system instruction group. This section is decoded from *A64 instruction index by encoding* on page C4-186. For additional information on this functional group of instructions, see *Branches, Exception generating, and System instructions* on page C3-138.



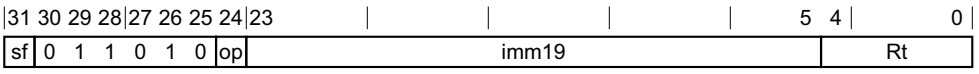


**Table C4-3 Encoding table for the Branches, Exception Generating and System instructions group**

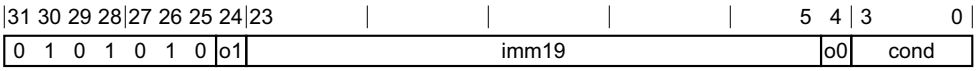
| Decode fields | | Decode group or instruction page |
|---|---|---|
| op0 | op1 | |
| 010 | 0xxx | *Conditional branch (immediate)* on page C4-192 |
| 010 | 1xxx | Unallocated. |
| 110 | 00xx | *Exception generation* on page C4-192 |
| 110 | 0100 | *System* on page C4-193 |
| 110 | 0101 | Unallocated. |
| 110 | 011x | Unallocated. |
| 110 | 1xxx | *Unconditional branch (register)* on page C4-194 |
| x00 | - | *Unconditional branch (immediate)* on page C4-194 |
| x01 | 0xxx | *Compare & branch (immediate)* |
| x01 | 1xxx | *Test & branch (immediate)* on page C4-194 |
| x11 | - | Unallocated. |

### C4.3.1 Compare & branch (immediate)

This section describes the encoding of the Compare & branch (immediate) instruction class. This section is decoded from *Branches, exception generating and system instructions*.



| Decode fields | | Instruction Page |
|---|---|---|
| sf | op | |
| 0 | 0 | CBZ - 32-bit variant |
| 0 | 1 | CBNZ - 32-bit variant |
| 1 | 0 | CBZ - 64-bit variant |
| 1 | 1 | CBNZ - 64-bit variant |

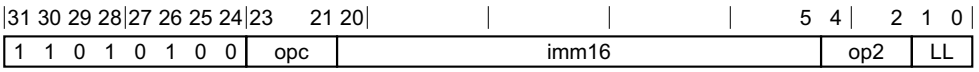
### C4.3.2 Conditional branch (immediate)

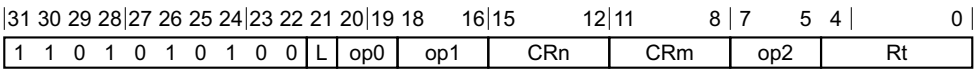


This section describes the encoding of the Conditional branch (immediate) instruction class. This section is decoded from *Branches, exception generating and system instructions* on page C4-191.

| Decode fields | | Instruction Page |
|---|---|---|
| o1 | o0 | |
| 0 | 0 | B.cond |
| 0 | 1 | Unallocated. |
| 1 | - | Unallocated. |

### C4.3.3 Exception generation

This section describes the encoding of the Exception generation instruction class. This section is decoded from *Branches, exception generating and system instructions* on page C4-191.



| Decode fields | | | Instruction Page |
|---|---|---|---|
| opc | op2 | LL | |
| - | xx1 | - | Unallocated. |
| - | x1x | - | Unallocated. |
| - | 1xx | - | Unallocated. |
| 000 | 000 | 00 | Unallocated. |
| 000 | 000 | 01 | SVC |
| 000 | 000 | 10 | HVC |
| 000 | 000 | 11 | SMC |
| 001 | 000 | x1 | Unallocated. |
| 001 | 000 | 00 | BRK |
| 001 | 000 | 1x | Unallocated. |
| 010 | 000 | x1 | Unallocated. |
| 010 | 000 | 00 | HLT |
| 010 | 000 | 1x | Unallocated. |
| 011 | 000 | - | Unallocated. |

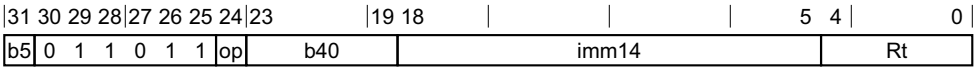
| Decode fields | | | Instruction Page |
|---|---|---|---|
| opc | op2 | LL | |
| 100 | 000 | - | Unallocated. |
| 101 | 000 | 00 | Unallocated. |
| 101 | 000 | 01 | DCPS1 |
| 101 | 000 | 10 | DCPS2 |
| 101 | 000 | 11 | DCPS3 |
| 11x | 000 | - | Unallocated. |

### C4.3.4 System

This section describes the encoding of the System instruction class. This section is decoded from *Branches, exception generating and system instructions* on page C4-191.



| Decode fields | | | | | | Instruction Page |
|---|---|---|---|---|---|---|
| L | op0 | op1 | CRn | op2 | Rt | |
| 0 | 00 | - | 000x | - | - | Unallocated. |
| 0 | 00 | - | 0100 | - | != 11111 | Unallocated. |
| 0 | 00 | - | 0100 | - | 11111 | MSR (immediate) |
| 0 | 00 | - | 0101 | - | - | Unallocated. |
| 0 | 00 | - | 011x | - | - | Unallocated. |
| 0 | 00 | - | 1xxx | - | - | Unallocated. |
| 0 | 00 | xx0 | 001x | - | - | Unallocated. |
| 0 | 00 | x0x | 001x | - | - | Unallocated. |
| 0 | 00 | 011 | 001x | - | != 11111 | Unallocated. |
| 0 | 00 | 011 | 0010 | - | 11111 | HINT |
| 0 | 00 | 011 | 0011 | 000 | - | Unallocated. |
| 0 | 00 | 011 | 0011 | 001 | - | Unallocated. |
| 0 | 00 | 011 | 0011 | 010 | 11111 | CLREX |
| 0 | 00 | 011 | 0011 | 011 | - | Unallocated. |

Non-Confidential - Beta

| Decode fields | | | Instruction Page |
|---|---|---|---|
| L | Rm | opcode | |
| 0 | 11111 | 0100 | ST3 (multiple structures) - Immediate offset variant |
| 0 | 11111 | 0110 | ST1 (multiple structures) - Three registers, immediate offset variant |
| 0 | 11111 | 0111 | ST1 (multiple structures) - One register, immediate offset variant |
| 0 | 11111 | 1000 | ST2 (multiple structures) - Immediate offset variant |
| 0 | 11111 | 1010 | ST1 (multiple structures) - Two registers, immediate offset variant |
| 1 | - | 0001 | Unallocated. |
| 1 | - | 0011 | Unallocated. |
| 1 | - | 0101 | Unallocated. |
| 1 | - | 1001 | Unallocated. |
| 1 | - | 1011 | Unallocated. |
| 1 | - | 11xx | Unallocated. |
| 1 | != 11111 | 0000 | LD4 (multiple structures) - Register offset variant |
| 1 | != 11111 | 0010 | LD1 (multiple structures) - Four registers, register offset variant |
| 1 | != 11111 | 0100 | LD3 (multiple structures) - Register offset variant |
| 1 | != 11111 | 0110 | LD1 (multiple structures) - Three registers, register offset variant |
| 1 | != 11111 | 0111 | LD1 (multiple structures) - One register, register offset variant |
| 1 | != 11111 | 1000 | LD2 (multiple structures) - Register offset variant |
| 1 | != 11111 | 1010 | LD1 (multiple structures) - Two registers, register offset variant |
| 1 | 11111 | 0000 | LD4 (multiple structures) - Immediate offset variant |
| 1 | 11111 | 0010 | LD1 (multiple structures) - Four registers, immediate offset variant |
| 1 | 11111 | 0100 | LD3 (multiple structures) - Immediate offset variant |
| 1 | 11111 | 0110 | LD1 (multiple structures) - Three registers, immediate offset variant |
| 1 | 11111 | 0111 | LD1 (multiple structures) - One register, immediate offset variant |
| 1 | 11111 | 1000 | LD2 (multiple structures) - Immediate offset variant |
| 1 | 11111 | 1010 | LD1 (multiple structures) - Two registers, immediate offset variant |

### C4.4.3 Advanced SIMD load/store single structure

This section describes the encoding of the Advanced SIMD load/store single structure instruction class. This section is decoded from *Loads and stores* on page C4-196.

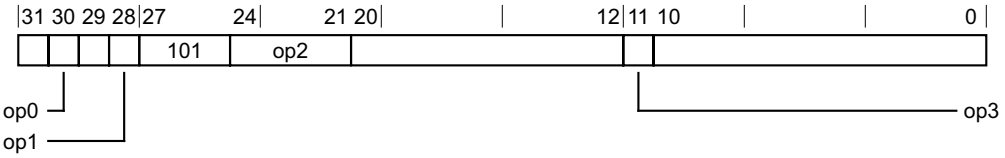
## C4.5 Data processing - register

This section describes the encoding of the Data processing (register) instruction group. This section is decoded from *A64 instruction index by encoding* on page C4-186. For additional information on this functional group of instructions, see *Data processing - register* on page C3-158.



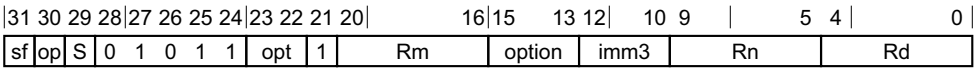


**Table C4-5 Encoding table for the Data Processing -- Register group**

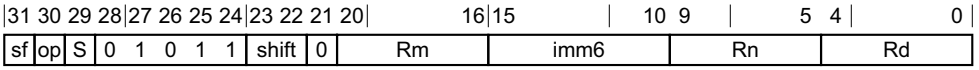
| Decode fields | | | | Decode group or instruction page |
|---|---|---|---|---|
| op0 | op1 | op2 | op3 | |
| 0 | 1 | 0110 | - | *Data-processing (2 source)* on page C4-223 |
| 1 | 1 | 0110 | - | *Data-processing (1 source)* on page C4-222 |
| - | 0 | 0xxx | - | *Logical (shifted register)* on page C4-225 |
| - | 0 | 1xx0 | - | *Add/subtract (shifted register)* on page C4-219 |
| - | 0 | 1xx1 | - | *Add/subtract (extended register)* |
| - | 1 | 0000 | - | *Add/subtract (with carry)* on page C4-219 |
| - | 1 | 0010 | 0 | *Conditional compare (register)* on page C4-221 |
| - | 1 | 0010 | 1 | *Conditional compare (immediate)* on page C4-220 |
| - | 1 | 0100 | - | *Conditional select* on page C4-221 |
| - | 1 | 0xx1 | - | Unallocated. |
| - | 1 | 1xxx | - | *Data-processing (3 source)* on page C4-224 |

### C4.5.1 Add/subtract (extended register)

This section describes the encoding of the Add/subtract (extended register) instruction class. This section is decoded from *Data processing - register*.



| Decode fields | | | | | Instruction Page |
|---|---|---|---|---|---|
| sf | op | S | opt | imm3 | |
| - | - | - | - | 1x1 | Unallocated. |
| - | - | - | - | 11x | Unallocated. |
| - | - | - | x1 | - | Unallocated. |
| - | - | - | 1x | - | Unallocated. |

## C4.6 Data processing - SIMD and floating point

This section describes the encoding of the Data processing (SIMD and floating-point) instruction group. This section is decoded from *A64 instruction index by encoding* on page C4-186. For additional information on this functional group of instructions, see *Data processing - SIMD and floating-point* on page C3-165.

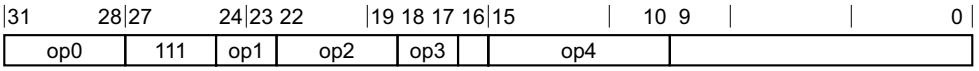

**Table C4-6 Encoding table for the Data Processing -- Scalar Floating-Point and Advanced SIMD group**

| Decode fields | | | | | Decode group or instruction page |
|---|---|---|---|---|---|

| 1 | - | - | - | Unallocated. |

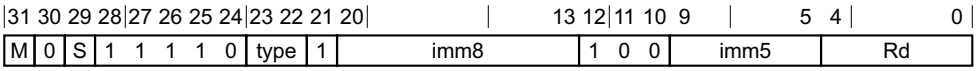
### C4.6.27 Floating-point data-processing (3 source)

This section describes the encoding of the Floating-point data-processing (3 source) instruction class. This section is decoded from *Data processing - SIMD and floating point* on page C4-227.



| Decode fields | | | | | Instruction Page |
|---|---|---|---|---|---|
| M | S | type | o1 | o0 | |
| - | - | 1x | - | - | Unallocated. |
| - | 1 | - | - | - | Unallocated. |
| 0 | 0 | 00 | 0 | 0 | FMADD - Single-precision variant |
| 0 | 0 | 00 | 0 | 1 | FMSUB - Single-precision variant |
| 0 | 0 | 00 | 1 | 0 | FNMADD - Single-precision variant |
| 0 | 0 | 00 | 1 | 1 | FNMSUB - Single-precision variant |
| 0 | 0 | 01 | 0 | 0 | FMADD - Double-precision variant |
| 0 | 0 | 01 | 0 | 1 | FMSUB - Double-precision variant |

# Chapter C5
# The A64 System Instruction Class

This chapter describes the A64 System instruction class, and the System instruction class encoding space, that is a subset of the System registers encoding space. It contains the following sections:

- *The System instruction class encoding space* on page C5-266.
- *Special-purpose registers* on page C5-289.
- *A64 system instructions for cache maintenance* on page C5-342.
- *A64 system instructions for address translation* on page C5-358.
- *A64 system instructions for TLB maintenance* on page C5-371.

See *Conventions used in AArch64 instruction and System register descriptions* on page C2-135 for information about entries used in the instruction encoding descriptions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C5.1 The System instruction class encoding space

Part of the A64 instruction encoding space is assigned to instructions that access the System register space. These instructions provide:

- Access to *System registers*, including the debug registers, that provide system control, and system status information.
- Access to Special-purpose registers such as SPSR_ELx, ELR_ELx, and the equivalent fields of the Process State.
- The cache and TLB maintenance instructions and address translation instructions.
- Barriers and the `CLREX` instruction.
- Architectural hint instructions.

This section describes the general model for accessing this functionality.

**Note**

In AArch32 state this functionality is provided through conceptual coprocessors CP14 and CP15, and in part through CP10 and CP11. These are accessed through a generic coprocessor interface. In ARMv8:

- AArch32 state retains this conceptual coprocessor model, and adds register and operation aliases, to simplify access to this functionality.
- In the instruction encoding descriptions, AArch64 state retains the naming of the instruction arguments as `op1`, `CRn`, `CRm`, and `op2`. However, there is no functional distinction between the `op`*n* arguments and the `CR`*x* arguments.

*Principles of the System instruction class encoding* describes some general properties of these encodings. *System instruction class encoding overview* on page C5-267 then describes the top-level encoding of these instructions, and the following sections then describe the next level of the encoding hierarchy:

- *op0==0b00, architectural hints, barriers and CLREX, and PSTATE access* on page C5-268.
- *op0==0b01, cache maintenance, TLB maintenance, and address translation instructions* on page C5-271.
- *op0==0b10, Moves to and from debug and trace System registers* on page C5-275.
- *op0==0b11, Moves to and from non-debug System registers and Special-purpose registers* on page C5-278.
- *Reserved encodings for IMPLEMENTATION DEFINED registers* on page C5-288.

### C5.1.1 Principles of the System instruction class encoding

In ARMv8, an encoding in the System instruction space is identified by a set of arguments, {`op0`, `op1`, `CRn`, `CRm`, `op2`}. These form an encoding hierarchy, where:

`op0` Defines the top-level division of the encoding space, see *System instruction class encoding overview* on page C5-267.

`op1` Identifies the lowest Exception level at which the encoding is accessible, as follows:

- **Accessible at EL0** `op1` has the value 3.
- **Accessible at EL1** `op1` has the value 0, 1, or 2. The value is the same as the `op1` value used to access the equivalent AArch32 register.
- **Accessible at EL2** `op1` has the value 4.
- **Accessible at EL3** `op1` has the value 6.

ARM strongly recommends that implementers adopt this use of `op1` when using the IMPLEMENTATION DEFINED regions of the encoding space described in *Reserved encodings for IMPLEMENTATION DEFINED registers* on page C5-288.

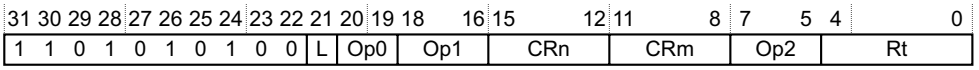
Non-Confidential - Beta

### System register width

In AArch64 state, each encoding in the System instruction space can provide access to a 64-bit register. An AArch64 System register is described as either a *32-bit register* or a *64-bit register*. For a 32-bit registers, the upper bits, bits[63:32], are RES0.



## C5.1.2 System instruction class encoding overview

The encoding of the System instruction class describes each instruction as being either:

- A transfer to a System register. This is a System instruction with the semantics of a write.
- A transfer from a System register. This is a System instruction with the semantics of a read.

A System instruction that initiates an operation operates as if it was making a transfer to a register.

In the AArch64 instruction set, the decode structure for the System instruction class is:

The value of L indicates the transfer direction:

**0** Transfer to System register.

**1** Transfer from System register.

The op0 field is the top level encoding of the System instruction type. Its possible values are:

0b00 These encodings provide:

- Instructions with an immediate field for accessing PSTATE, the current PE state.
- The architectural hint instructions.
- Barriers and the CLREX instruction.

For more information about these encodings, see *op0==0b00, architectural hints, barriers and CLREX, and PSTATE access* on page C5-268.

0b01 These encodings provide the cache maintenance, TLB maintenance, and address translation instructions.

**Note**

These are equivalent to operations in the AArch32 CP15 space.

For more information, see *op0==0b01, cache maintenance, TLB maintenance, and address translation instructions* on page C5-271.

0b10 These encodings provide moves to and from:

- Legacy AArch32 System registers for execution environments, to provide access to these registers from higher exception levels that are using AArch64.
- Debug and trace registers.

**Note**

These are equivalent to the registers in the AArch32 CP14 space.

For more information, see *op0==0b10, Moves to and from debug and trace System registers* on page C5-275.

0b11 These encodings provide:

- Moves to and from Non-debug System registers. The accessed registers provide system control, and system status information.

  **Note**

  The accessed registers are equivalent to the registers in the AArch32 CP15 space.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Access to Special-purpose registers.

For more information, see *Instructions for accessing Special-purpose registers* on page C5-287 and *Instructions for accessing non-debug System registers* on page C5-278.

### UNDEFINED behaviors

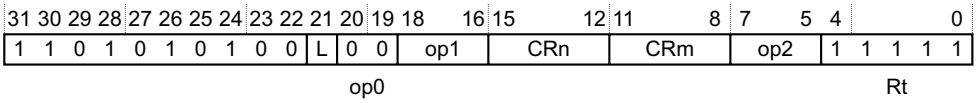
In the System register instruction encoding space, the following principles apply:

- All unallocated encodings are treated as UNDEFINED.
- All encodings with `L==1` and `op0==0b0x` are UNDEFINED, except for encodings in the area reserved for IMPLEMENTATION DEFINED use, see *Reserved encodings for IMPLEMENTATION DEFINED registers* on page C5-288.

For registers and operations that are accessible from a particular Exception level, any attempt to access those registers from a lower Exception level is UNDEFINED.

If a particular Exception level:

- Defines a register to be RO, then any attempt to write to that register, at that Exception level, is UNDEFINED. This means that any access to that register with `L==0` is UNDEFINED.
- Defines a register to be WO, then any attempt to read from that register, at that Exception level, is UNDEFINED. This means that any access to that register with `L==1` is UNDEFINED.



For IMPLEMENTATION DEFINED encoding spaces, the treatment of the encodings is IMPLEMENTATION DEFINED, but see the recommendation in *Principles of the System instruction class encoding* on page C5-266.

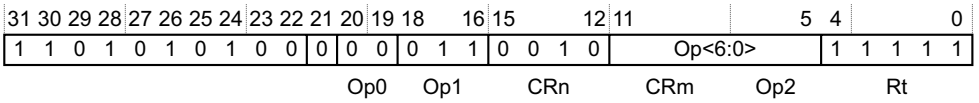
## C5.1.3 `op0==0b00`, architectural hints, barriers and `CLREX`, and PSTATE access

The different groups of System register instructions with `op0==0b00`:

- Are identified by the value of `CRn`.
- Are always encoded with a value of `0b11111` in the `Rt` field.

The encoding of these instructions is:

The encoding of the `CRn` field is as follows:



**0b0010** See *Architectural hint instructions*.

**0b0011** See *Barriers and CLREX* on page C5-269.

**0b0100** See *Instructions for accessing the PSTATE fields* on page C5-270.

### Architectural hint instructions

Within the `op0==0b00` encodings, the architectural hint instructions are identified by `CRn` having the value `0b0010`. The encoding of these instructions is:

The value of `op<6:0>`, formed by concatenating the `CRm` and `op2` fields, determines the hint instruction as follows:

`0b0000000` `NOP` instruction. This has no effect on architectural state other than to advance the PC.

`0b0000001` `YIELD` instruction.

`0b0000010` `WFE` instruction.

`0b0000011` `WFI` instruction.

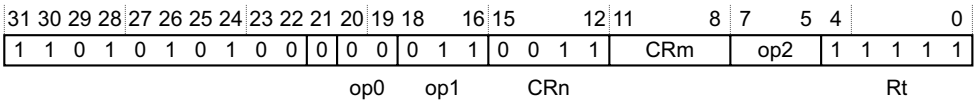
`0b0000100` `SEV` instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

0b0000101 SEVL instruction.

0b0000110-0b1111111
Unallocated values. These encodings behave as NOPs.

**Note**



- Instruction encodings with bits[4:0] not set to 0b11111 are UNDEFINED.
- The operation of the A64 instructions for architectural hints are identical to the corresponding A32 and T32 instructions.

For more information about:

- The WFE, WFI, SEV, and SEVL instructions, see *Mechanisms for entering a low-power state* on page D1-1611.
- The YIELD instruction, see *Software control features and EL0* on page B1-64.

### Barriers and CLREX

Within the op0==0b00 encodings, the barriers and CLREX instructions are identified by CRn having the value 0b0011. The encoding of these instructions is:

The value of op2 determines the instruction, as follows. For the DSB and DMB instructions, CRm controls the instruction options.

0b010 CLREX instruction. The value of CRm is ignored.

0b100 DSB instruction. The value of CRm sets the option type, see Table C5-1.

0b101 DMB instruction. The value of CRm sets the option type, see Table C5-1.

0b110 ISB instruction. The value of CRm is ignored.

0b000, 0b001, 0b011, 0b111
UNDEFINED.

**Note**

Instruction encodings with bits[4:0] not set to 0b11111 are UNDEFINED.

Table C5-1 shows the CRm encodings for the data barrier option types.

**Table C5-1 CRm encoding for DMB and DSB instructions**

| CRm value | Option, for DMB and DSB | Meaning |
|---|---|---|
| 0001 | OSHLD | Outer Shareable, load |
| 0010 | OSHST | Outer Shareable, store |
| 0011 | OSH | Outer Shareable, all |
| 0101 | NSHLD | Non-shareable, load |
| 0110 | NSHST | Non-shareable, store |
| 0111 | NSH | Non-shareable, all |
| 1001 | ISHLD | Inner Shareable, load |
| 1010 | ISHST | Inner Shareable, store |
| 1011 | ISH | Inner Shareable, all |

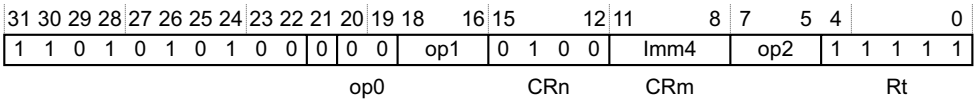
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table C5-1 CRm encoding for DMB and DSB instructions (continued)**

| CRm value | Option, for DMB and DSB | Meaning |
|---|---|---|
| 1101 | LD | Full system, load |
| 1110 | ST | Full system, store |
| 0000, 0100, 1000, 1100 | #<imm>[a] | Full system, all |
| 1111 | SY | Full system, all |

a. #<imm> is a 4-bit unsigned immediate in the range 0-15, encoded in the CRm field.

**Note**



The operation of the A64 instructions for barriers and CLREX are identical to the corresponding A32 and T32 instructions.

For more information about:

- The barrier instructions, see *Memory barriers* on page B2-86.
- The CLREX instruction, see *Synchronization and semaphores* on page B2-107.

## Instructions for accessing the PSTATE fields

Within the op0==0b00 encodings, the instructions that can be used to modify PSTATE fields directly are identified by CRn having the value 0b0100. The encoding of these instructions is:

These instructions are:

```
MSR DAIFSet, #Imm4    ; Used to set any or all of DAIF to 1
MSR DAIFClr, #Imm4    ; Used to clear any or all of DAIF to 0
MSR SPSel, #Imm1      ; Used to select the Stack Pointer, between SP_EL0 and SP_ELx
```

The value of op2 selects the instruction form, which defines the constraints on the values of the op1 and Imm4 arguments, as follows:

op2==0b101 Selects the MSR SPSel instruction.

op1 must be 0b000.

This instruction is accessible at EL1 or higher.

Imm4<0> selects the accessed stack pointer, as follows:

**0** Selects SP_EL0.

**1** Selects *SP_ELx* on page K13-5712, where *x* is the number of the current Exception level, 1, 2, or 3.

Imm4<3:1> are SBZ.

op2==0b110 Selects the MSR DAIFSet instruction, that sets the specified PSTATE.{D, A, I, F} bits to 1.

op1 must be 0b011.

This instruction is accessible at EL1 or higher, and when the value of the SCTLR_EL1.UMA bit is 1 it is also accessible at EL0.

Imm4 determines which of the PSTATE.{D, A, I, F} bits are set to 1, as follows:

Imm4<3> If this bit is set to 1 then the D bit is set to 1, otherwise the D bit is not changed.

Imm4<2> If this bit is set to 1 then the A bit is set to 1, otherwise the A bit is not changed.

Imm4<1> If this bit is set to 1 then the I bit is set to 1, otherwise the I bit is not changed.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`Imm4<0>` If this bit is set to 1 then the F bit is set to 1, otherwise the F bit is not changed.

`op2==0b111` Selects the `MSR DAIFClr` instruction, that clears the specified PSTATE.{D, A, I, F} bits to 0.

`op1` must be `0b011`.

This instruction is accessible at EL1 or higher, and when the value of the SCTLR_EL1.UMA bit is 1 it is also accessible at EL0.

`Imm4` determines which of the PSTATE.{D, A, I, F} bits is cleared to 0, as follows:

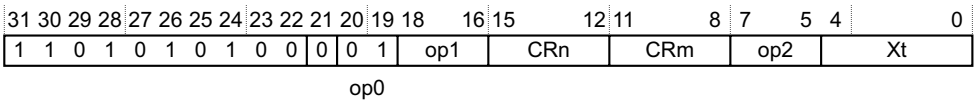
`Imm4<3>` If this bit is set to 1 then the D bit is cleared to 0, otherwise the D bit is not changed.

`Imm4<2>` If this bit is set to 1 then the A bit is cleared to 0, otherwise the A bit is not changed.

`Imm4<1>` If this bit is set to 1 then the I bit is cleared to 0, otherwise the I bit is not changed.

`Imm4<0>` If this bit is set to 1 then the F bit is cleared to 0, otherwise the F bit is not changed.

All other combinations of `op1` and `op2` are reserved, and the corresponding instructions are UNDEFINED.



**Note**

For PSTATE updates, instruction encodings with bits[4:0] not set to `0b11111` are UNDEFINED.

Writes to PSTATE.{D, A, I, F} occur in program order without the need for additional synchronization. Changing PSTATE.SPSel to use EL0 synchronizes any updates to SP_EL0 that have been written by an `MSR` to SP_EL0, without the need for additional synchronization.

### C5.1.4 `op0==0b01`, cache maintenance, TLB maintenance, and address translation instructions

The System instructions are encoded with `op0==0b01`. The different groups of System instructions are identified by the values of `CRn` and `CRm`, except that some of this encoding space is reserved for IMPLEMENTATION DEFINED functionality. The encoding of these instructions is:

The grouping of these instructions depending on the `CRn` and `CRm` fields is as follows:

`CRn==7` The instruction group is determined by the value of `CRm`, as follows:

- `CRm=={1, 5}` Instruction cache maintenance instructions.
- `CRm==4` Data cache zero operation.
- `CRm=={6, 10, 11, 14}` Data cache maintenance instructions.

  See *Cache maintenance instructions, and data cache zero* on page C5-272.
- `CRm==8` See *Address translation instructions* on page C5-273.

`CRn==8` See *TLB maintenance instructions* on page C5-274.

`CRn=={11, 15}` See *Reserved encoding space for IMPLEMENTATION DEFINED instructions* on page C5-275.

Non-Confidential - Beta

### Cache maintenance instructions, and data cache zero

Table C5-2 lists the Cache maintenance instructions and their encodings. Instructions that take an argument include `Xt` in the instruction syntax. For instructions that do not take an argument, the Xt field is encoded as `0b11111`.

**Table C5-2 Cache maintenance instructions**

| Instruction | Access instruction encoding | | | | | Notes |
|---|---|---|---|---|---|---|
| | op0 | op1 | CRn | CRm | op2 | |
| **Instruction cache maintenance instructions** | | | | | | |
| IC IALLUIS | 1 | 0 | 7 | 1 | 0 | Accessible from EL1 or higher. |
| IC IALLU | | | | 5 | 0 | |
| IC IVAU, `Xt` | | 3 | 7 | 5 | 1 | When SCTLR_EL1.UCI == 1, accessible from EL0 or higher. Otherwise, accessible from EL1 or higher. |
| **Data cache maintenance instructions** | | | | | | |
| DC IVAC, `Xt` | 1 | 0 | 7 | 6 | 1 | Accessible from EL1 or higher. |
| DC ISW, `Xt` | | | | | 2 | |
| DC CSW, `Xt` | | | | 10 | 2 | |
| DC CISW, `Xt` | | | | 14 | 2 | |
| DC CVAC, `Xt` | | 3 | 7 | 10 | 1 | When SCTLR_EL1.UCI == 1, accessible from EL0 or higher. Otherwise, accessible from EL1 or higher. |
| DC CVAU, `Xt` | | | | 11 | 1 | |
| DC CIVAC, `Xt` | | | | 14 | 1 | |
| **Data cache zero operation** | | | | | | |
| DC ZVA, `Xt` | 1 | 3 | 7 | 4 | 1 | When SCTLR_EL1.UCI == 1, accessible from EL0 or higher. Otherwise, accessible from EL1 or higher. |

For more information about these instructions, see *Overview of the cache maintenance instructions* on page D3-1712 and *Cache maintenance instructions* on page D3-1716.

### Address translation instructions

Table C5-3 lists the Address translation instructions and their encodings. The syntax of the instructions includes `Xt`, that provides the address to be translated.

**Table C5-3 Address translation instructions**

| Instruction | Access instruction encoding | | | | | Notes |
|---|---|---|---|---|---|---|
| | op0 | op1 | CRn | CRm | op2 | |
| AT S1E1R, `Xt` | 1 | 0 | 7 | 8 | 0 | Accessible from EL1 or higher. |
| AT S1E1W, `Xt` | | | | | 1 | |
| AT S1E0R, `Xt` | | | | | 2 | |
| AT S1E0W, `Xt` | | | | | 3 | |
| AT S1E2R, `Xt` | | 4 | 7 | 8 | 0 | Accessible from EL2 or higher. |
| AT S1E2W, `Xt` | | | | | 1 | |
| AT S12E1R, `Xt` | | | | | 4 | |
| AT S12E1W, `Xt` | | | | | 5 | |
| AT S12E0R, `Xt` | | | | | 6 | |
| AT S12E0W, `Xt` | | | | | 7 | |
| AT S1E3R, `Xt` | | 6 | 7 | 8 | 0 | Accessible only from EL3. |
| AT S1E3W, `Xt` | | | | | 1 | |

For more information about these instructions, see *Address translation instructions* on page D4-1795.

*Non-Confidential - Beta*

### TLB maintenance instructions

Table C5-4 lists the TLB maintenance instructions and their encodings. Instructions that take an argument include `Xt` in the instruction syntax. For instructions that do not take an argument, the Xt field is encoded as `0b11111`.

**Table C5-4 TLB maintenance instructions**

| Instruction | Access instruction encoding | | | | | Notes |
|---|---|---|---|---|---|---|
| | op0 | op1 | CRn | CRm | op2 | |
| TLBI VMALLE1IS | 1 | 0 | 8 | 3 | 0 | Accessible from EL1 or higher. |
| TLBI VAE1IS, Xt | | | | | 1 | |
| TLBI ASIDE1IS, Xt | | | | | 2 | |
| TLBI VAAE1IS, Xt | | | | | 3 | |
| TLBI VALE1IS, Xt | | | | | 5 | |
| TLBI VAALE1IS, Xt | | | | | 7 | |
| TLBI VMALLE1 | | | | 7 | 0 | Accessible from EL1 or higher. |
| TLBI VAE1, Xt | | | | | 1 | |
| TLBI ASIDE1, Xt | | | | | 2 | |
| TLBI VAAE1, Xt | | | | | 3 | |
| TLBI VALE1, Xt | | | | | 5 | |
| TLBI VAALE1, Xt | | | | | 7 | |
| TLBI IPAS2E1IS, Xt | 1 | 4 | 8 | 0 | 1 | Accessible from EL2 or higher. |
| TLBI IPAS2LE1IS, Xt | | | | | 5 | |
| TLBI ALLE2IS | | | | 3 | 0 | |
| TLBI VAE2IS, Xt | | | | | 1 | |
| TLBI ALLE1IS | | | | | 4 | |
| TLBI VALE2IS, Xt | | | | | 5 | |
| TLBI VMALLS12E1IS | | | | | 6 | |
| TLBI IPAS2E1, Xt | | | | 4 | 1 | |
| TLBI IPAS2LE1, Xt | | | | | 5 | |
| TLBI ALLE2 | | | | 7 | 0 | |
| TLBI VAE2, Xt | | | | | 1 | |
| TLBI ALLE1 | | | | | 4 | |
| TLBI VALE2, Xt | | | | | 5 | |
| TLBI VMALLS12E1 | | | | | 6 | |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

**Table C5-4 TLB maintenance instructions (continued)**

| Instruction | Access instruction encoding | | | | | Notes |
|---|---|---|---|---|---|---|
| | op0 | op1 | CRn | CRm | op2 | |
| TLBI ALLE3IS | 1 | 6 | 8 | 3 | 0 | Accessible only from EL3. |
| TLBI VAE3IS, Xt | | | | | 1 | |
| TLBI VALE3IS, Xt | | | | | 5 | |
| TLBI ALLE3 | | | | 7 | 0 | |
| TLBI VAE3, Xt | | | | | 1 | |
| TLBI VALE3, Xt | | | | | 5 | |

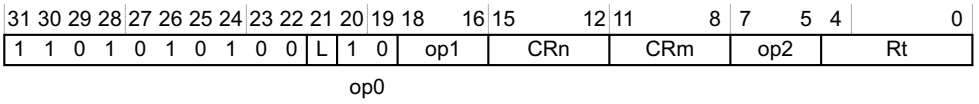
For more information about these instructions, see *TLB maintenance instructions* on page D4-1839.

### Reserved encoding space for IMPLEMENTATION DEFINED instructions

The A64 instruction set reserves the following encoding space for IMPLEMENTATION DEFINED instructions:

The value of L defines the use of Rt as follows:

**0** Rt is an argument supplied to the instruction.



**1** Rt is a result returned by the instruction.

IMPLEMENTATION DEFINED instructions in this encoding space are accessed using the SYS and SYSL instructions, see *SYS* on page C6-807 and *SYSL* on page C6-809.

See also *Reserved encodings for IMPLEMENTATION DEFINED registers* on page C5-288.

## C5.1.5 op0==0b10, Moves to and from debug and trace System registers

The instructions that move data to and from the debug, Execution environment, and trace System registers are encoded with op0==0b10. This means the encoding of these instructions is:

**Note**

These encodings access the registers that are equivalent to the AArch32 CP14 registers.

The value of op1 provides the next level of decode of these instructions, as follows:

**op1 == {0, 3, 4}**

Debug. See *Instructions for accessing debug System registers* on page C5-276

**Note**

The standard encoding of debug registers is op0==0b10, op1=={0, 3, 4}. The following sections describe registers in the op0==0b10 encoding space that are classified as debug registers, see *Instructions for accessing non-debug System registers* on page C5-278:

- *MDCR_EL2, Monitor Debug Configuration Register (EL2)* on page D7-2208.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- *MDCR_EL3, Monitor Debug Configuration Register (EL3)* on page D7-2212.
- *SDER32_EL3, AArch32 Secure Debug Enable Register* on page D7-2234.

`op1` == **1** Trace. See the appropriate trace architecture specification.

### Instructions for accessing debug System registers

The instructions for accessing debug System registers are:

```
MSR <System register>, Xt    ; Write to System register
MRS Xt, <System register>    ; Read from System register
```

Where `<System_register>` is the register name, for example MDCCSR_EL0.

This section includes only the System register access encodings for which both:

- `op0` is `0b10`.
- The value of `op1` is one of {0, 3, 4}.

**Note**

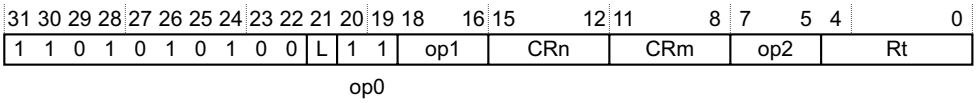
These encodings access the registers that are equivalent to the AArch32 CP14 registers.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Table C5-5 shows the mapping of the System register encodings for debug System register access.

**Table C5-5 System instruction encodings for debug System register access**

| Register | Access instruction encoding | | | | | Permitted accesses |
|---|---|---|---|---|---|---|
| | op0 | op1 | CRn | CRm | op2 | |
| OSDTRRX_EL1 | 2 | 0 | 0 | 0 | 2 | RW |
| MDCCINT_EL1 | | | | 2 | 0 | RW |
| MDSCR_EL1 | | | | | 2 | RW |
| OSDTRTX_EL1 | | | | 3 | 2 | RW |
| OSECCR_EL1 | | | | 6 | 2 | RW |
| DBGBVR<n>_EL1 | | | | 0-15[a] | 4 | RW |
| DBGBCR<n>_EL1 | | | | 0-15[a] | 5 | RW |
| DBGWVR<n>_EL1 | | | | 0-15[a] | 6 | RW |
| DBGWCR<n>_EL1 | | | | 0-15[a] | 7 | RW |
| MDRAR_EL1 | | | 1 | 0 | 0 | RO |
| OSLAR_EL1 | | | | | 4 | WO |
| OSLSR_EL1 | | | | 1 | 4 | RO |
| OSDLR_EL1 | | | | 3 | 4 | RW |
| DBGPRCR_EL1 | | | | 4 | 4 | RW |
| DBGCLAIMSET_EL1 | | | 7 | 8 | 6 | RW |
| DBGCLAIMCLR_EL1 | | | | 9 | 6 | RW |
| DBGAUTHSTATUS_EL1 | | | | 14 | 6 | RO |
| MDCCSR_EL0 | | 3 | 0 | 1 | 0 | RO |
| DBGDTR_EL0 | | | | 4 | 0 | RW |
| DBGDTRRX_EL0 | | | | 5 | 0 | RO |
| DBGDTRTX_EL0 | | | | | | WO |
| DBGVCR32_EL2 | | 4 | 0 | 7 | 0 | RW |



a. Unimplemented breakpoint and watchpoint register access instructions are unallocated. CRm encodes <*n*>, the breakpoint or watchpoint number.

For more information see *Mapping of the System registers between the Execution states* on page D1-1622.

Non-Confidential - Beta

### C5.1.6 op0==0b11, Moves to and from non-debug System registers and Special-purpose registers

The instructions that move data to and from non-debug System registers are encoded with op0==0b11, except that some of this encoding space is reserved for IMPLEMENTATION DEFINED functionality. The encoding of these instructions is:

The value of CRn provides the next level of decode of these instructions, as follows:

**CRn==0b0000, 0b0001, 0b0010, 0b0011, 0b0101, 0b0110, 0b0111, 0b1001, 0b1010, 0b1100, 0b1101, 0b1110**

See *Instructions for accessing non-debug System registers*.

**CRn==0b0100** See *Instructions for accessing Special-purpose registers* on page C5-287.

**CRn==0b1011, 0b1111** See *Reserved encodings for IMPLEMENTATION DEFINED registers* on page C5-288.

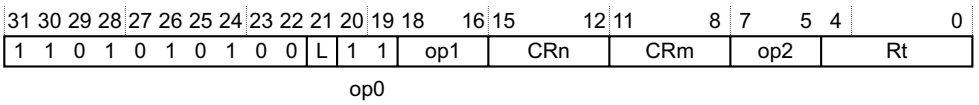
#### Instructions for accessing non-debug System registers

The A64 instructions for accessing System registers are:

```
MSR <System register>, Xt    ; Write to System register
MRS Xt, <System register>    ; Read from System register
```

Where <System_register> is the register name, for example MIDR_EL1.

This section includes only the System register access encodings for which both:



- op0 is 0b11.
- The value of CRn is one of {0, 1, 2, 3, 5, 6, 7, 9, 10, 12, 13, 14}.

**Note**

- These encodings access the registers that are equivalent to the AArch32 CP15 registers.
- While this group is described as accessing the non-debug System registers, its correct characterization is by the {op0, CRn} values given in this subsection, and the group includes the debug registers described in the following sections:
  - *MDCR_EL2, Monitor Debug Configuration Register (EL2)* on page D7-2208.
  - *MDCR_EL3, Monitor Debug Configuration Register (EL3)* on page D7-2212.
  - *SDER32_EL3, AArch32 Secure Debug Enable Register* on page D7-2234.

  These registers are exceptions to the standard encoding of debug registers, that has op0==0b10, see *Instructions for accessing debug System registers* on page C5-276.

The instruction encoding for these accesses is:

See text for permitted values of CRn

Table C5-6 on page C5-279 shows the encodings of the register access instructions. In the *Notes* on page C5-279 column of the table:

**Config-RO** Means it is configurable whether read accesses are permitted. Write accesses are UNDEFINED.

**Config-WO** Means it is configurable whether write accesses are permitted. Read accesses are UNDEFINED.

**Config-RW** Means it is configurable whether accesses are permitted. Either read and write accesses are permitted, or read and write accesses are UNDEFINED.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

See the register descriptions for information about the control that determines whether these accesses are permitted.

**Table C5-6 System instruction encodings for non-Debug System register accesses**

| Register accessed | Width (bits) | Access instruction encoding | | | | | Notes |

Non-Confidential - Beta

### *About the GIC System registers*

From version 3.0 of the GIC architecture specification, the specification defines three groups of System registers, identified by the prefix of the register name:

**ICC_** GIC physical CPU interface System registers.

**ICH_** GIC virtual interface control System registers.

**ICV_** GIC Virtual CPU interface System registers.

**Note**

These registers are in addition to the GIC memory-mapped register groups GICC_, GICD_, GICH_, GICR_, GICV_, and GITS_.

When implemented, the GIC System registers form part of an ARM processor implementation, and therefore these registers are included in the register summaries. However, the registers are defined only in the GIC Architecture Specification.

As Table C5-6 on page C5-279 shows, the ICV_* registers have the same {`op0`, `op1`, `CRn`, `CRm`, `op2`} encodings as the corresponding ICC_* registers. For these encodings, GIC register configuration fields determine which register is accessed.

For more information see the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0* (ARM IHI 0069).

## Instructions for accessing Special-purpose registers

The A64 instructions for accessing Special-purpose registers are:

```
MSR <Special-purpose register>, Xt    ; Write to Special-purpose register
MRS Xt, <Special-purpose register>    ; Read from Special-purpose register
```

For these accesses, `CRn` has the value 4. The encoding for Special-purpose register accesses is:

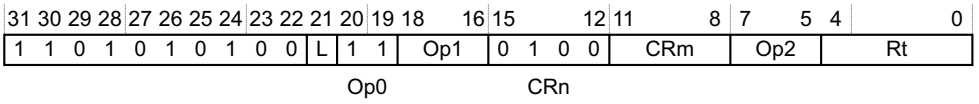

Table C5-7 lists the encodings for `op1`, `CRm`, and `op2` fields for accesses to the Special-purpose registers in AArch64.

**Table C5-7 Special-purpose register accesses**

| Register | Access instruction encoding | | | | | Notes |
|---|---|---|---|---|---|---|
| | op0 | op1 | CRn | CRm | op2 | |
| SPSR_EL1 | 3 | 0 | 4 | 0 | 0 | Accessible from EL1 or higher. |
| ELR_EL1 | | | | | 1 | |
| SP_EL0 | | | | 1 | 0 | Accessible from EL1 or higher. If SP_EL0 is the current stack pointer then the access is UNDEFINED. |
| SPSel | | | | 2 | 0 | Accessible from EL1 or higher. |
| CurrentEL | | | | | 2 | RO. Accessible from EL1 or higher. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

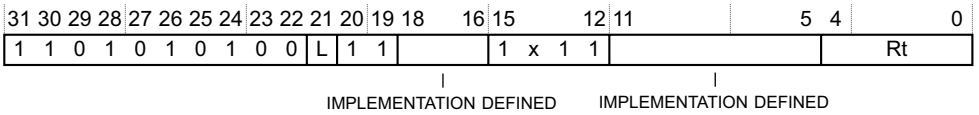

**Table C5-7 Special-purpose register accesses (continued)**

| Register | Access instruction encoding | | | | | Notes |
|---|---|---|---|---|---|---|
| | op0 | op1 | CRn | CRm | op2 | |
| DAIF | 3 | 3 | 4 | 2 | 1 | Configurable whether accesses at EL0 are permitted. |
| NZCV | | | | | 0 | Accessible from EL0 or higher. |
| FPCR | | | | 4 | 0 | Accessible from EL0 or higher. |
| FPSR | | | | | 1 | |
| DSPSR_EL0 | | | | 5 | 0 | Accessible only in Debug state, from EL0 or higher. |
| DLR_EL0 | | | | | 1 | |
| SPSR_EL2 | 3 | 4 | 4 | 0 | 0 | Accessible from EL2 or higher. |
| ELR_EL2 | | | | | 1 | |
| SP_EL1 | | | | 1 | 0 | |
| SPSR_irq | | | | 3 | 0 | |
| SPSR_abt | | | | | 1 | |
| SPSR_und | | | | | 2 | |
| SPSR_fiq | | | | | 3 | |
| SPSR_EL3 | 3 | 6 | 4 | 0 | 0 | Accessible from EL3 or higher. |
| ELR_EL3 | | | | | 1 | |
| SP_EL2 | | | | 1 | 0 | |

All direct and indirect reads and writes to Special-purpose registers appear to occur in program order relative to other instructions.

### Reserved encodings for IMPLEMENTATION DEFINED registers

The System register encoding space with `op0==0b11` reserves the following encodings for IMPLEMENTATION DEFINED registers:

The value of `L` defines the access type and the use of `Rt` as follows:

**0** Write the value in `Rt` to the IMPLEMENTATION DEFINED register.

**1** Read the value of the IMPLEMENTATION DEFINED register to `Rt`.

For more information about these encodings see *S3_<op1>_<Cn>_<Cm>_<op2>, IMPLEMENTATION DEFINED registers* on page D7-2107. As that section describes, any IMPLEMENTATION DEFINED registers are accessed in a similar way to architecturally-defined System registers, using `MRS` and `MSR` instructions, see:

- *MRS* on page C6-660.
- *MSR (immediate)* on page C6-661.
- *MSR (register)* on page C6-663.

See also *Reserved encoding space for IMPLEMENTATION DEFINED instructions* on page C5-275.

Non-Confidential - Beta

## C5.2 Special-purpose registers

The Special-purpose registers are:

- CurrentEL, DAIF, and NZCV, that return PSTATE information.
- The ELRs, DLR_EL0 and ELR_ELx, that hold the return address for the return from Debug state, or for the exception return.
- FPCR and FPSR, that provide floating-point status and control.
- The stack pointers, SP_ELx, and stack pointer selector, SPSel.
- The SPSRs, DSPSR_EL0 and SPSR_ELx, that hold the PE state from immediately before entering Debug state or taking an exception. This means they hold the state required for the return from Debug state, or for the exception return.
- SPSR_abt, SPSR_fiq, SPSR_irq, and SPSR_und, that map to the corresponding AArch32 registers.

**Note**

The AArch32 SPSRs SPSR_hyp, SPSR_mon, and SPSR_svc are mapped to the AArch64 SPSR_ELx registers.

The characteristic of a Special-purpose register is that all direct and indirect reads and writes to the register appear to occur in program order relative to other instructions, without the need for any explicit synchronization.

This section describes the following registers:

- CurrentEL, that software can read to determine the current Exception level.
- DAIF, that specifies the current interrupt mask bits.
- DLR_EL0, that holds the address to return to for a return from Debug state.
- DSPSR_EL0, that holds process state on entry to Debug state.
- ELR_EL1, that holds the address to return to for an exception return from EL1.
- ELR_EL2, that holds the address to return to for an exception return from EL2.
- ELR_EL3, that holds the address to return to for an exception return from EL3.
- FPCR, that provides control of floating-point operation.
- FPSR, that provides floating-point status information.
- NZCV, that holds the condition flags.
- SP_EL0, that holds the stack pointer for EL0.
- SP_EL1, that holds the stack pointer for EL1.
- SP_EL2, that holds the stack pointer for EL2.
- SP_EL3, that holds the stack pointer for EL3.
- SPSel, that at EL1 or higher selects between the SP for the current Exception level and SP_EL0.
- SPSR_abt, that holds process state on taking an exception to AArch32 Abort mode.
- SPSR_EL1, that holds process state on taking an exception to AArch64 EL1.
- SPSR_EL2, that holds process state on taking an exception to AArch64 EL2.
- SPSR_EL3, that holds process state on taking an exception to AArch64 EL3.
- SPSR_fiq, that holds process state on taking an exception to AArch32 FIQ mode.
- SPSR_irq, that holds process state on taking an exception to AArch32 IRQ mode.
- SPSR_und, that holds process state on taking an exception to AArch32 Undefined mode.

### C5.2.1 CurrentEL, Current Exception Level

The CurrentEL characteristics are:

**Purpose**

Holds the current Exception level.

**Usage constraints**

This register is accessible as follows:

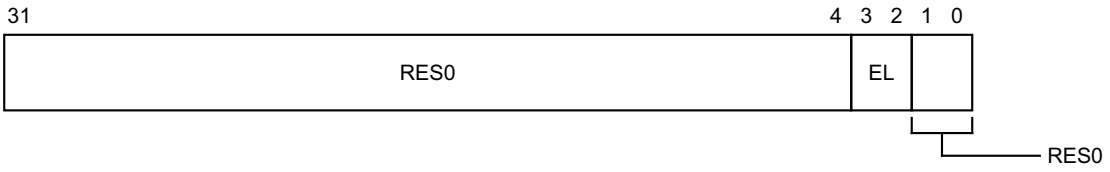
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RO | RO | RO | RO | RO |

A write to the CurrentEL register is UNDEFINED.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There are no configuration notes.

**Attributes**

CurrentEL is a 32-bit register.

#### Field descriptions

The CurrentEL bit assignments are:

**Bits [31:4]**

Reserved, RES0.

**EL, bits [3:2]**

Current Exception level. Possible values of this field are:

`00` EL0

`01` EL1

`10` EL2

`11` EL3

When this register has an architecturally-defined reset value, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.

#### Accessing the CurrentEL:

To access the CurrentEL:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MRS <Xt>, CurrentEL ; Read CurrentEL into Xt
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 000 | 0100 | 0010 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.2 DAIF, Interrupt Mask Bits

The DAIF characteristics are:

**Purpose**

Allows access to the interrupt mask bits.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

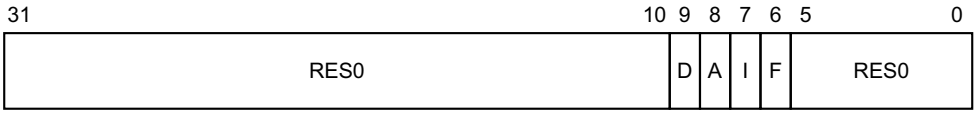
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If SCTLR_EL1.UMA==0, EL0 accesses to this register are trapped to EL1.

**Configurations**



Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DAIF is a 32-bit register.

#### Field descriptions

The DAIF bit assignments are:

**Bits [31:10]**

Reserved, RES0.

**D, bit [9]**

Process state D mask. The possible values of this bit are:

`0` Debug exceptions from Watchpoint, Breakpoint, and Software step debug events targeted at the current Exception level are not masked.

`1` Debug exceptions from Watchpoint, Breakpoint, and Software step debug events targeted at the current Exception level are masked.

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

When this register has an architecturally-defined reset value, this field resets to `1`.

**A, bit [8]**

SError (System Error) mask bit. The possible values of this bit are:

`0` Exception not masked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 Exception masked.

When this register has an architecturally-defined reset value, this field resets to 1.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

When this register has an architecturally-defined reset value, this field resets to 1.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

When this register has an architecturally-defined reset value, this field resets to 1.

**Bits [5:0]**

Reserved, RES0.

### Accessing the DAIF:

To access the DAIF:

```
MRS <Xt>, DAIF ; Read DAIF into Xt
MSR DAIF, <Xt> ; Write Xt to DAIF
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 0100 | 0010 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.3 DLR_EL0, Debug Link Register

The DLR_EL0 characteristics are:

**Purpose**

In Debug state, holds the address to restart from.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RW | RW | RW | RW | RW | RW |

Access to this register is from Debug state only. During normal execution this register is unallocated.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register DLR_EL0[31:0] is architecturally mapped to AArch32 System register DLR.

**Attributes**

DLR_EL0 is a 64-bit register.

#### Field descriptions

DLR_EL0 is a member of multiple register groups and is defined elsewhere. For the full definition, see DLR_EL0.

#### Accessing the DLR_EL0:

To access the DLR_EL0:

```
MRS <Xt>, DLR_EL0 ; Read DLR_EL0 into Xt
MSR DLR_EL0, <Xt> ; Write Xt to DLR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 0100 | 0101 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.4 DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

**Purpose**

Holds the saved process state on entry to Debug state.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RW | RW | RW | RW | RW | RW |

Access to this register is from Debug state only. During normal execution this register is unallocated.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register DSPSR_EL0 is architecturally mapped to AArch32 System register DSPSR.

**Attributes**

DSPSR_EL0 is a 32-bit register.

#### Field descriptions

DSPSR_EL0 is a member of multiple register groups and is defined elsewhere. For the full definition, see DSPSR_EL0.

#### Accessing the DSPSR_EL0:

To access the DSPSR_EL0:

```
MRS <Xt>, DSPSR_EL0 ; Read DSPSR_EL0 into Xt
MSR DSPSR_EL0, <Xt> ; Write Xt to DSPSR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 0100 | 0101 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.5 ELR_EL1, Exception Link Register (EL1)

The ELR_EL1 characteristics are:

**Purpose**

When taking an exception to EL1, holds the address to return to.

**Usage constraints**

This register is accessible as follows:

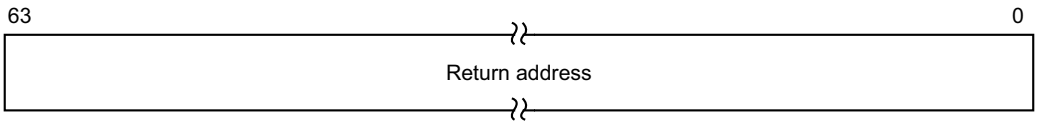
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

An exception return from EL1 using AArch64 makes ELR_EL1 become UNKNOWN.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There are no configuration notes.

**Attributes**

ELR_EL1 is a 64-bit register.

#### Field descriptions

The ELR_EL1 bit assignments are:

**Bits [63:0]**

Return address.

#### Accessing the ELR_EL1:

To access the ELR_EL1:

```
MRS <Xt>, ELR_EL1 ; Read ELR_EL1 into Xt
MSR ELR_EL1, <Xt> ; Write Xt to ELR_EL1
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 000 | 0100 | 0000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.6 ELR_EL2, Exception Link Register (EL2)

The ELR_EL2 characteristics are:

**Purpose**

When taking an exception to EL2, holds the address to return to.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

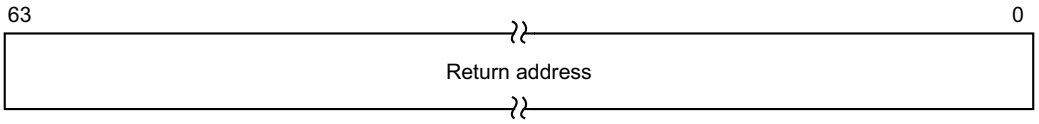
An exception return from EL2 using AArch64 makes ELR_EL2 become UNKNOWN.

When EL2 is in AArch32 Execution state and an exception is taken from EL0, EL1, or EL2 to EL3 and AArch64 execution, the upper 32-bits of ELR_EL2 are either set to 0 or hold the same value that they did before AArch32 execution. Which option is adopted is determined by an implementation, and might vary dynamically within an implementation. Correspondingly software must regard the value as being an UNKNOWN choice between the two values.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



AArch64 System register ELR_EL2 is architecturally mapped to AArch32 System register ELR_hyp.

**Attributes**

ELR_EL2 is a 64-bit register.

#### Field descriptions

The ELR_EL2 bit assignments are:

**Bits [63:0]**

Return address.

#### Accessing the ELR_EL2:

To access the ELR_EL2:

```
MRS <Xt>, ELR_EL2 ; Read ELR_EL2 into Xt
MSR ELR_EL2, <Xt> ; Write Xt to ELR_EL2
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 100 | 0100 | 0000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.7 ELR_EL3, Exception Link Register (EL3)

The ELR_EL3 characteristics are:

**Purpose**

When taking an exception to EL3, holds the address to return to.

**Usage constraints**

This register is accessible as follows:

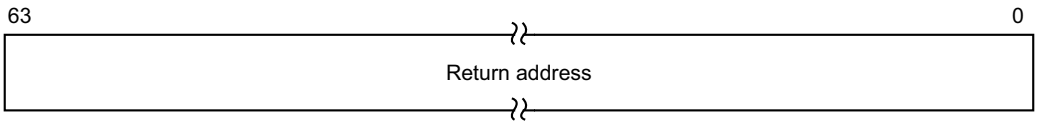
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | RW | RW |

An exception return from EL3 using AArch64 makes ELR_EL3 become UNKNOWN.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There are no configuration notes.

**Attributes**

ELR_EL3 is a 64-bit register.

#### Field descriptions

The ELR_EL3 bit assignments are:

**Bits [63:0]**

Return address.

#### Accessing the ELR_EL3:

To access the ELR_EL3:

```
MRS <Xt>, ELR_EL3 ; Read ELR_EL3 into Xt
MSR ELR_EL3, <Xt> ; Write Xt to ELR_EL3
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 110 | 0100 | 0000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.8 FPCR, Floating-point Control Register

The FPCR characteristics are:

**Purpose**

Controls floating-point behavior.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RW | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If CPACR_EL1.FPEN==00, EL0 and EL1 accesses to this register are trapped to EL1.

If CPACR_EL1.FPEN==01, EL0 accesses to this register are trapped to EL1.

If CPACR_EL1.FPEN==10, EL0 and EL1 accesses to this register are trapped to EL1.

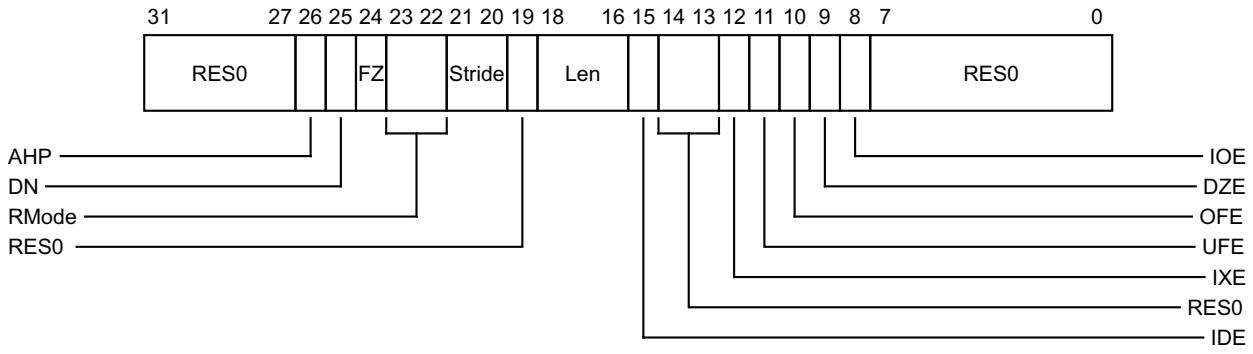
If CPTR_EL2.TFP==1, Non-secure EL0, EL1, and EL2 accesses to this register are trapped to EL2.

If CPTR_EL3.TFP==1, EL0, EL1, EL2, and EL3 accesses to this register are trapped to EL3.

**Configurations**

The named fields in this register map to the equivalent fields in the AArch32 FPSCR.

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

FPCR is a 32-bit register.

#### Field descriptions

The FPCR bit assignments are:

**Bits [31:27]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**AHP, bit [26]**

Alternative half-precision control bit:

0 IEEE half-precision format selected.

1 Alternative half-precision format selected.

**DN, bit [25]**

Default NaN mode control bit:

0 NaN operands propagate through to the output of a floating-point operation.

1 Any operation involving one or more NaNs returns the Default NaN.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

**FZ, bit [24]**

Flush-to-zero mode control bit:

0 Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.

1 Flush-to-zero mode enabled.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

**RMode, bits [23:22]**

Rounding Mode control field. The encoding of this field is:

00 Round to Nearest (RN) mode

01 Round towards Plus Infinity (RP) mode

10 Round towards Minus Infinity (RM) mode

11 Round towards Zero (RZ) mode.

The specified rounding mode is used by both scalar and Advanced SIMD floating-point instructions.

**Stride, bits [21:20]**

This field has no function in AArch64, and non-zero values are ignored during AArch64 execution. It is included only for context saving and restoration of AArch32 FPSCR.Stride.

**Bit [19]**

Reserved, RES0.

**Len, bits [18:16]**

This field has no function in AArch64, and non-zero values are ignored during AArch64 execution. It is included only for context saving and restoration of AArch32 FPSCR.Len.

**IDE, bit [15]**

Input Denormal exception trap enable. Possible values are:

0 Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.IDC bit is set to 1.

1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IDC bit. The trap handling software can decide whether to set the FPSR.IDC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RES0.

**Bits [14:13]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IXE, bit [12]**

Inexact exception trap enable. Possible values are:

`0` Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.IXC bit is set to 1.

`1` Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IXC bit. The trap handling software can decide whether to set the FPSR.IXC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RES0.

**UFE, bit [11]**

Underflow exception trap enable. Possible values are:

`0` Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.UFC bit is set to 1.

`1` Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.UFC bit. The trap handling software can decide whether to set the FPSR.UFC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RES0.

**OFE, bit [10]**

Overflow exception trap enable. Possible values are:

`0` Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.OFC bit is set to 1.

`1` Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.OFC bit. The trap handling software can decide whether to set the FPSR.OFC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RES0.

**DZE, bit [9]**

Division by Zero exception trap enable. Possible values are:

`0` Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.DZC bit is set to 1.

`1` Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.DZC bit. The trap handling software can decide whether to set the FPSR.DZC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RES0.

**IOE, bit [8]**

Invalid Operation exception trap enable. Possible values are:

`0` Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.IOC bit is set to 1.

`1` Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IOC bit. The trap handling software can decide whether to set the FPSR.IOC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RES0.

Non-Confidential - Beta

**Bits [7:0]**

Reserved, RES0.

### Accessing the FPCR:

To access the FPCR:

```
MRS <Xt>, FPCR ; Read FPCR into Xt
MSR FPCR, <Xt> ; Write Xt to FPCR
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 0100 | 0100 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.9 FPSR, Floating-point Status Register

The FPSR characteristics are:

**Purpose**

Provides floating-point system status information.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RW | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If CPACR_EL1.FPEN==00, EL0 and EL1 accesses to this register are trapped to EL1.

If CPACR_EL1.FPEN==01, EL0 accesses to this register are trapped to EL1.

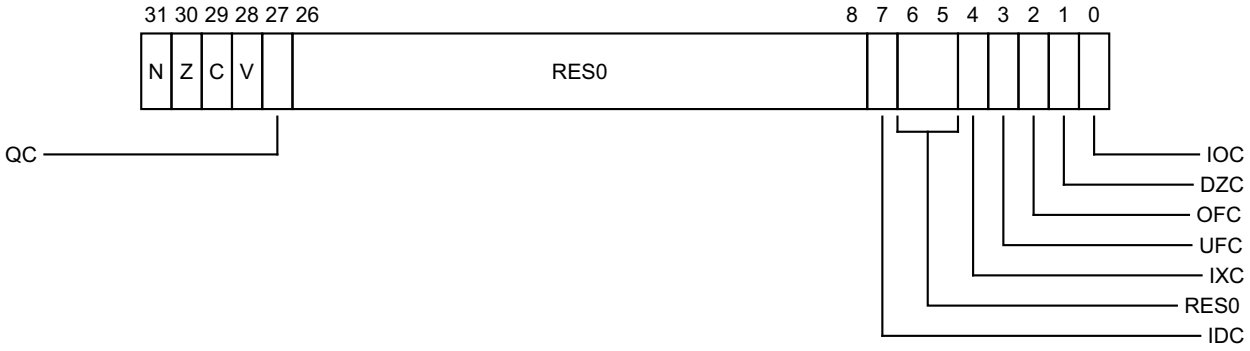
If CPACR_EL1.FPEN==10, EL0 and EL1 accesses to this register are trapped to EL1.

If CPTR_EL2.TFP==1, Non-secure EL0, EL1, and EL2 accesses to this register are trapped to EL2.

If CPTR_EL3.TFP==1, EL0, EL1, EL2, and EL3 accesses to this register are trapped to EL3.

**Configurations**

The named fields in this register map to the equivalent fields in the AArch32 FPSCR.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

FPSR is a 32-bit register.

#### Field descriptions

The FPSR bit assignments are:

**N, bit [31]**

Negative condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.N flag instead.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Z, bit [30]**

Zero condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.Z flag instead.

**C, bit [29]**

Carry condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.C flag instead.

**V, bit [28]**

Overflow condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.V flag instead.

**QC, bit [27]**

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

**Bits [26:8]**

Reserved, RES0.

**IDC, bit [7]**

Input Denormal cumulative exception bit. This bit is set to 1 to indicate that the Input Denormal exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IDE bit. This bit is only set to 1 to indicate an exception if FPCR.IDE is 0, or if trapping software sets it.

**Bits [6:5]**

Reserved, RES0.

**IXC, bit [4]**

Inexact cumulative exception bit. This bit is set to 1 to indicate that the Inexact exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IXE bit. This bit is only set to 1 to indicate an exception if FPCR.IXE is 0, or if trapping software sets it.

**UFC, bit [3]**

Underflow cumulative exception bit. This bit is set to 1 to indicate that the Underflow exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.UFE bit. This bit is only set to 1 to indicate an exception if FPCR.UFE is 0, or if trapping software sets it.

**OFC, bit [2]**

Overflow cumulative exception bit. This bit is set to 1 to indicate that the Overflow exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.OFE bit. This bit is only set to 1 to indicate an exception if FPCR.OFE is 0, or if trapping software sets it.

**DZC, bit [1]**

Division by Zero cumulative exception bit. This bit is set to 1 to indicate that the Division by Zero exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.DZE bit. This bit is only set to 1 to indicate an exception if FPCR.DZE is 0, or if trapping software sets it.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IOC, bit [0]**

Invalid Operation cumulative exception bit. This bit is set to 1 to indicate that the Invalid Operation exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IOE bit. This bit is only set to 1 to indicate an exception if FPCR.IOE is 0, or if trapping software sets it.

### Accessing the FPSR:

To access the FPSR:

```
MRS <Xt>, FPSR ; Read FPSR into Xt
MSR FPSR, <Xt> ; Write Xt to FPSR
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 0100 | 0100 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.10 NZCV, Condition Flags

The NZCV characteristics are:

**Purpose**

Allows access to the condition flags.

**Usage constraints**

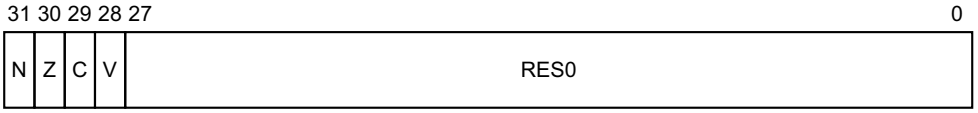
This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RW | RW | RW | RW | RW | RW |

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There are no configuration notes.

**Attributes**

NZCV is a 32-bit register.

#### Field descriptions

The NZCV bit assignments are:

**N, bit [31]**

Negative condition flag. Set to 1 if the result of the last flag-setting instruction was negative.

**Z, bit [30]**

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

**C, bit [29]**

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

**V, bit [28]**

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

**Bits [27:0]**

Reserved, RES0.

#### Accessing the NZCV:

To access the NZCV:

```
MRS <Xt>, NZCV ; Read NZCV into Xt
MSR NZCV, <Xt> ; Write Xt to NZCV
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 0100 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.11 SP_EL0, Stack Pointer (EL0)

The SP_EL0 characteristics are:

**Purpose**

Holds the stack pointer associated with EL0. At higher Exception levels, this is used as the current stack pointer when the value of SPSel.SP is 0.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

This accessibility information only applies when the value of SPSel.SP is 1, and only for accesses using the MRS or MSR instructions. In addition, this register is accessible at EL0 as the current stack pointer.

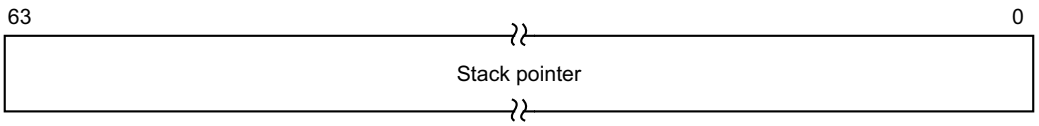
When the value of SPSel.SP is 0:

- Any access to SP_EL0 using the MRS or MSR instructions is UNDEFINED.
- This register is accessible at all Exception levels as the current stack pointer.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There are no configuration notes.

**Attributes**

SP_EL0 is a 64-bit register.

#### Field descriptions

The SP_EL0 bit assignments are:

**Bits [63:0]**

Stack pointer.

#### Accessing the SP_EL0:

To access the SP_EL0:

```
MRS <Xt>, SP_EL0 ; Read SP_EL0 into Xt
MSR SP_EL0, <Xt> ; Write Xt to SP_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 000 | 0100 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.12 SP_EL1, Stack Pointer (EL1)

The SP_EL1 characteristics are:

**Purpose**

Holds the stack pointer associated with EL1. When executing at EL1, the value of SPSel.SP determines the current stack pointer:

| SPSel.SP | current stack pointer |
|---|---|
| 0 | SP_EL0 |
| 1 | SP_EL1 |

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of SPSel.SP is 1, this register is also accessible at EL1 as the current stack pointer.

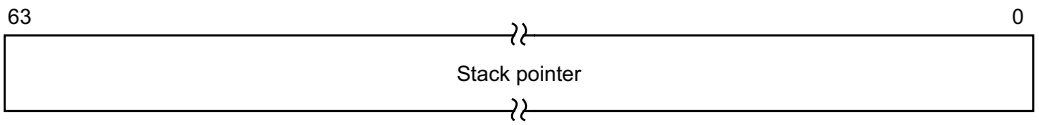
**Note**

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There are no configuration notes.

**Attributes**

SP_EL1 is a 64-bit register.

#### Field descriptions

The SP_EL1 bit assignments are:

**Bits [63:0]**

Stack pointer.

#### Accessing the SP_EL1:

To access the SP_EL1:

```
MRS <Xt>, SP_EL1 ; Read SP_EL1 into Xt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MSR SP_EL1, <Xt> ; Write Xt to SP_EL1
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 100 | 0100 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.13 SP_EL2, Stack Pointer (EL2)

The SP_EL2 characteristics are:

**Purpose**

Holds the stack pointer associated with EL2. When executing at EL2, the value of SPSel.SP determines the current stack pointer:

| SPSel.SP | current stack pointer |
|---|---|
| 0 | SP_EL0 |
| 1 | SP_EL2 |

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | RW | RW |

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of SPSel.SP is 1, this register is also accessible at EL2 as the current stack pointer.

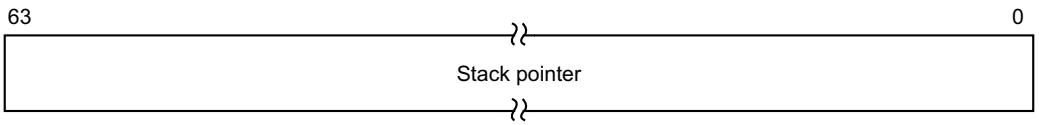
**Note**

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There are no configuration notes.

**Attributes**

SP_EL2 is a 64-bit register.

#### Field descriptions

The SP_EL2 bit assignments are:

**Bits [63:0]**

Stack pointer.

#### Accessing the SP_EL2:

To access the SP_EL2:

```
MRS <Xt>, SP_EL2 ; Read SP_EL2 into Xt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MSR SP_EL2, <Xt> ; Write Xt to SP_EL2
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 110 | 0100 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.14 SP_EL3, Stack Pointer (EL3)

The SP_EL3 characteristics are:

**Purpose**

Holds the stack pointer associated with EL3. When executing at EL3, the value of SPSel.SP determines the current stack pointer:

| SPSel.SP | current stack pointer |
|---|---|
| 0 | SP_EL0 |
| 1 | SP_EL3 |

**Usage constraints**

This register is not accessible using MRS and MSR instructions.

When the value of SPSel.SP is 1, this register is accessible at EL3 as the current stack pointer.

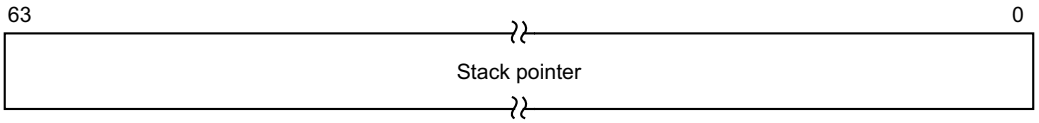
**Note**

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There are no configuration notes.

**Attributes**

SP_EL3 is a 64-bit register.

#### Field descriptions

The SP_EL3 bit assignments are:

**Bits [63:0]**

Stack pointer.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.15 SPSel, Stack Pointer Select

The SPSel characteristics are:

**Purpose**

Allows the Stack Pointer to be selected between SP_EL0 and SP_ELx.

**Usage constraints**

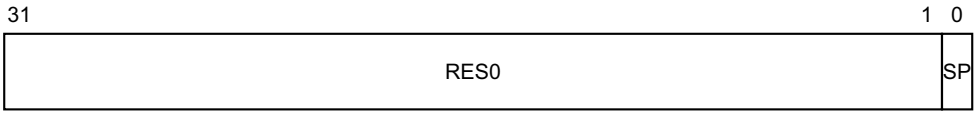
This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSel is a 32-bit register.

#### Field descriptions

The SPSel bit assignments are:

**Bits [31:1]**

Reserved, RES0.

**SP, bit [0]**

Stack pointer to use. Possible values of this bit are:

0 Use SP_EL0 at all Exception levels.

1 Use SP_ELx for Exception level ELx.

When this register has an architecturally-defined reset value, this field resets to 1.

#### Accessing the SPSel:

To access the SPSel:

```
MRS <Xt>, SPSel ; Read SPSel into Xt
MSR SPSel, <Xt> ; Write Xt to SPSel
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 000 | 0100 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.16 SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Abort mode.

**Usage constraints**

This register is accessible as follows:

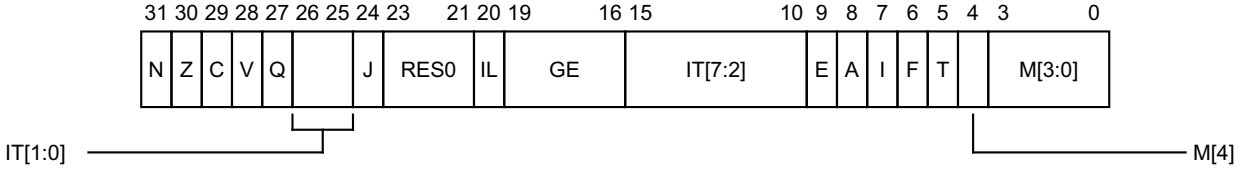
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register SPSR_abt is architecturally mapped to AArch32 System register SPSR_abt.



If EL1 does not support execution in AArch32, this register is RES0.

**Attributes**

SPSR_abt is a 32-bit register.

## Field descriptions

The SPSR_abt bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Abort mode, and copied to CPSR.N on executing an exception return operation in Abort mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Abort mode, and copied to CPSR.Z on executing an exception return operation in Abort mode.

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to Abort mode, and copied to CPSR.C on executing an exception return operation in Abort mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to Abort mode, and copied to CPSR.V on executing an exception return operation in Abort mode.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0 Taken from A32 state.

1 Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

1 Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0110 | Monitor |
| 0b0111 | Abort |
| 0b1010 | Hyp |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved.

### Accessing the SPSR_abt:

To access the SPSR_abt:

```
MRS <Xt>, SPSR_abt ; Read SPSR_abt into Xt
MSR SPSR_abt, <Xt> ; Write Xt to SPSR_abt
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 100 | 0100 | 0011 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.17 SPSR_EL1, Saved Program Status Register (EL1)

The SPSR_EL1 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL1.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

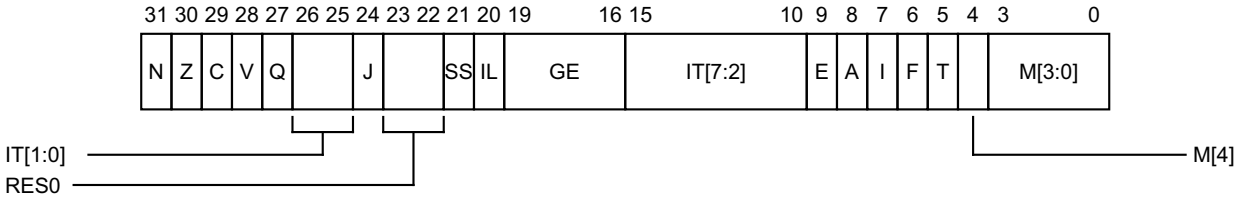
An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register SPSR_EL1 is architecturally mapped to AArch32 System register SPSR_svc.



**Attributes**

SPSR_EL1 is a 32-bit register.

## Field descriptions

The SPSR_EL1 bit assignments are:

***When exception taken from AArch32:***

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Supervisor mode, and copied to CPSR.N on executing an exception return operation in Supervisor mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Supervisor mode, and copied to CPSR.Z on executing an exception return operation in Supervisor mode.

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to Supervisor mode, and copied to CPSR.C on executing an exception return operation in Supervisor mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to Supervisor mode, and copied to CPSR.V on executing an exception return operation in Supervisor mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:22]**

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

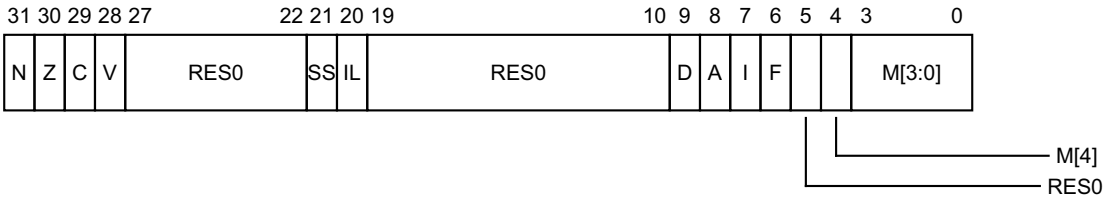
`0` Taken from A32 state.

`1` Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

`1` Exception taken from AArch32.



**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| `0b0000` | User |
| `0b0001` | FIQ |
| `0b0010` | IRQ |
| `0b0011` | Supervisor |
| `0b0111` | Abort |
| `0b1011` | Undefined |
| `0b1111` | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5501.

***When exception taken from AArch64:***

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**N, bit [31]**

Set to the value of the N condition flag on taking an exception to EL1, and copied to the N condition flag on executing an exception return operation in EL1.

**Z, bit [30]**

Set to the value of the Z condition flag on taking an exception to EL1, and copied to the Z condition flag on executing an exception return operation in EL1.

**C, bit [29]**

Set to the value of the C condition flag on taking an exception to EL1, and copied to the C condition flag on executing an exception return operation in EL1.

**V, bit [28]**

Set to the value of the V condition flag on taking an exception to EL1, and copied to the V condition flag on executing an exception return operation in EL1.

**Bits [27:22]**

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**Bits [19:10]**

Reserved, RES0.

**D, bit [9]**

Process state D mask. The possible values of this bit are:

`0` Debug exceptions from Watchpoint, Breakpoint, and Software step debug events targeted at the current Exception level are not masked.

`1` Debug exceptions from Watchpoint, Breakpoint, and Software step debug events targeted at the current Exception level are masked.

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

**A, bit [8]**

SError (System Error) mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**Bit [5]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

`0` Exception taken from AArch64.

**M[3:0], bits [3:0]**

AArch64 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| `0b0000` | EL0t |
| `0b0100` | EL1t |
| `0b0101` | EL1h |

Other values are reserved, and returning to an Exception level that is using AArch64 with a reserved value in this field is treated as an illegal exception return.

The bits in this field are interpreted as follows:

- M[3:2] holds the Exception Level.
- M[1] is unused and is RES0 for all non-reserved values.
- M[0] is used to select the SP:
  - — 0 means the SP is always SP0.
  - — 1 means the exception SP is determined by the EL.

### Accessing the SPSR_EL1:

To access the SPSR_EL1:

```
MRS <Xt>, SPSR_EL1 ; Read SPSR_EL1 into Xt
MSR SPSR_EL1, <Xt> ; Write Xt to SPSR_EL1
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 000 | 0100 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.18 SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL2.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

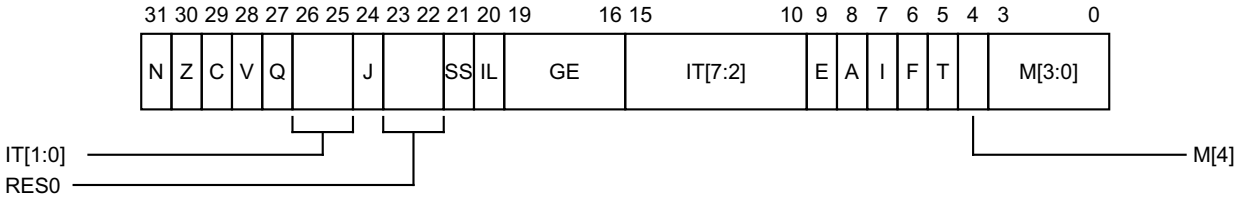
An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register SPSR_EL2 is architecturally mapped to AArch32 System register SPSR_hyp.



**Attributes**

SPSR_EL2 is a 32-bit register.

## Field descriptions

The SPSR_EL2 bit assignments are:

***When exception taken from AArch32:***

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Hyp mode, and copied to CPSR.N on executing an exception return operation in Hyp mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Hyp mode, and copied to CPSR.Z on executing an exception return operation in Hyp mode.

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to Hyp mode, and copied to CPSR.C on executing an exception return operation in Hyp mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to Hyp mode, and copied to CPSR.V on executing an exception return operation in Hyp mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:22]**

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

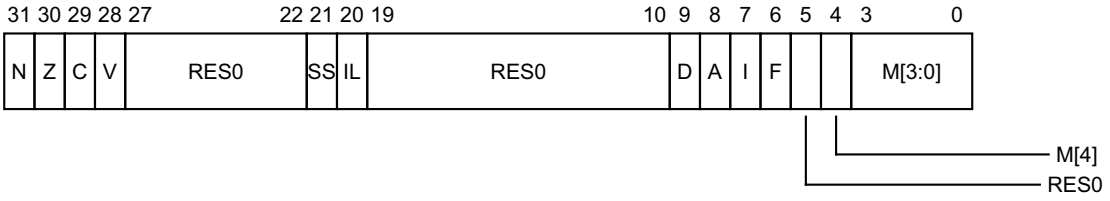
`0` Taken from A32 state.

`1` Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

`1` Exception taken from AArch32.



**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| `0b0000` | User |
| `0b0001` | FIQ |
| `0b0010` | IRQ |
| `0b0011` | Supervisor |
| `0b0111` | Abort |
| `0b1010` | Hyp |
| `0b1011` | Undefined |
| `0b1111` | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5501.

***When exception taken from AArch64:***

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**N, bit [31]**

Set to the value of the N condition flag on taking an exception to EL2, and copied to the N condition flag on executing an exception return operation in EL2.

**Z, bit [30]**

Set to the value of the Z condition flag on taking an exception to EL2, and copied to the Z condition flag on executing an exception return operation in EL2.

**C, bit [29]**

Set to the value of the C condition flag on taking an exception to EL2, and copied to the C condition flag on executing an exception return operation in EL2.

**V, bit [28]**

Set to the value of the V condition flag on taking an exception to EL2, and copied to the V condition flag on executing an exception return operation in EL2.

**Bits [27:22]**

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**Bits [19:10]**

Reserved, RES0.

**D, bit [9]**

Process state D mask. The possible values of this bit are:

`0` Debug exceptions from Watchpoint, Breakpoint, and Software step debug events targeted at the current Exception level are not masked.

`1` Debug exceptions from Watchpoint, Breakpoint, and Software step debug events targeted at the current Exception level are masked.

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

**A, bit [8]**

SError (System Error) mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**Bit [5]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

`0` Exception taken from AArch64.

**M[3:0], bits [3:0]**

AArch64 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| `0b0000` | EL0t |
| `0b0100` | EL1t |
| `0b0101` | EL1h |
| `0b1000` | EL2t |
| `0b1001` | EL2h |

Other values are reserved, and returning to an Exception level that is using AArch64 with a reserved value in this field is treated as an illegal exception return.

The bits in this field are interpreted as follows:

- M[3:2] holds the Exception Level.
- M[1] is unused and is RES0 for all non-reserved values.
- M[0] is used to select the SP:
  - — 0 means the SP is always SP0.
  - — 1 means the exception SP is determined by the EL.

### Accessing the SPSR_EL2:

To access the SPSR_EL2:

```
MRS <Xt>, SPSR_EL2 ; Read SPSR_EL2 into Xt
MSR SPSR_EL2, <Xt> ; Write Xt to SPSR_EL2
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 100 | 0100 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.19 SPSR_EL3, Saved Program Status Register (EL3)

The SPSR_EL3 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL3.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | RW | RW |

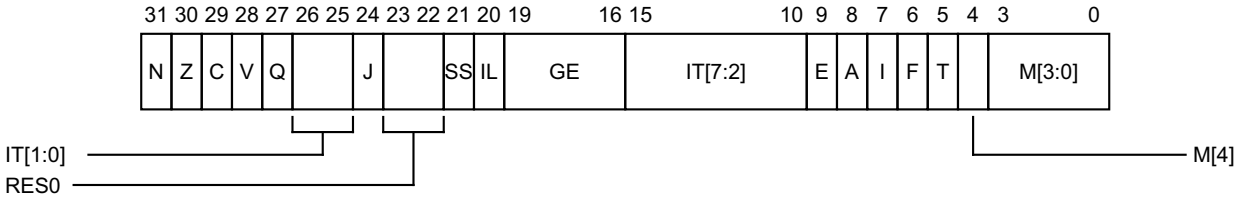
An exception return from EL3 using AArch64 makes SPSR_EL3 become UNKNOWN.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register SPSR_EL3 can be mapped to AArch32 System register SPSR_mon, but this is not architecturally mandated.



**Attributes**

SPSR_EL3 is a 32-bit register.

#### Field descriptions

The SPSR_EL3 bit assignments are:

***When exception taken from AArch32:***

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Monitor mode, and copied to CPSR.N on executing an exception return operation in Monitor mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Monitor mode, and copied to CPSR.Z on executing an exception return operation in Monitor mode.

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to Monitor mode, and copied to CPSR.C on executing an exception return operation in Monitor mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to Monitor mode, and copied to CPSR.V on executing an exception return operation in Monitor mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:22]**

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

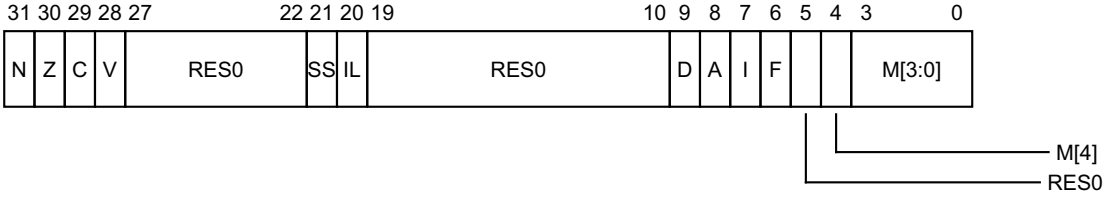
`0` Taken from A32 state.

`1` Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

`1` Exception taken from AArch32.



**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| `0b0000` | User |
| `0b0001` | FIQ |
| `0b0010` | IRQ |
| `0b0011` | Supervisor |
| `0b0110` | Monitor |
| `0b0111` | Abort |
| `0b1010` | Hyp |
| `0b1011` | Undefined |
| `0b1111` | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5501.

***When exception taken from AArch64:***

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**N, bit [31]**

Set to the value of the N condition flag on taking an exception to EL3, and copied to the N condition flag on executing an exception return operation in EL3.

**Z, bit [30]**

Set to the value of the Z condition flag on taking an exception to EL3, and copied to the Z condition flag on executing an exception return operation in EL3.

**C, bit [29]**

Set to the value of the C condition flag on taking an exception to EL3, and copied to the C condition flag on executing an exception return operation in EL3.

**V, bit [28]**

Set to the value of the V condition flag on taking an exception to EL3, and copied to the V condition flag on executing an exception return operation in EL3.

**Bits [27:22]**

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**Bits [19:10]**

Reserved, RES0.

**D, bit [9]**

Process state D mask. The possible values of this bit are:

`0` Debug exceptions from Watchpoint, Breakpoint, and Software step debug events targeted at the current Exception level are not masked.

`1` Debug exceptions from Watchpoint, Breakpoint, and Software step debug events targeted at the current Exception level are masked.

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

**A, bit [8]**

SError (System Error) mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**Bit [5]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

`0` Exception taken from AArch64.

**M[3:0], bits [3:0]**

AArch64 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| `0b0000` | EL0t |
| `0b0100` | EL1t |
| `0b0101` | EL1h |
| `0b1000` | EL2t |
| `0b1001` | EL2h |
| `0b1100` | EL3t |
| `0b1101` | EL3h |

Other values are reserved, and returning to an Exception level that is using AArch64 with a reserved value in this field is treated as an illegal exception return.

The bits in this field are interpreted as follows:

- M[3:2] holds the Exception Level.
- M[1] is unused and is RES0 for all non-reserved values.
- M[0] is used to select the SP:
  - — 0 means the SP is always SP0.
  - — 1 means the exception SP is determined by the EL.

### Accessing the SPSR_EL3:

To access the SPSR_EL3:

```
MRS <Xt>, SPSR_EL3 ; Read SPSR_EL3 into Xt
MSR SPSR_EL3, <Xt> ; Write Xt to SPSR_EL3
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 110 | 0100 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.2.20 SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to FIQ mode.

**Usage constraints**

This register is accessible as follows:

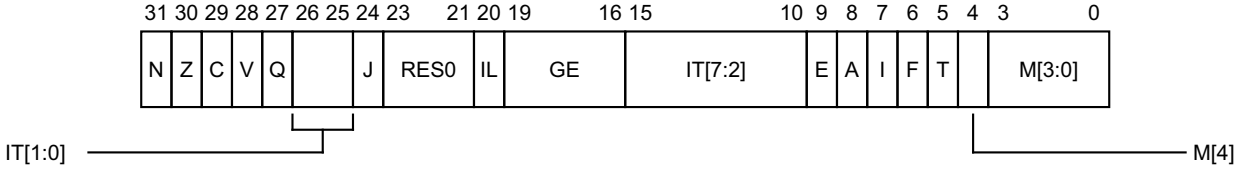
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register SPSR_fiq is architecturally mapped to AArch32 System register SPSR_fiq.



If EL1 does not support execution in AArch32, this register is RES0.

**Attributes**

SPSR_fiq is a 32-bit register.

#### Field descriptions

The SPSR_fiq bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to FIQ mode, and copied to CPSR.N on executing an exception return operation in FIQ mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to FIQ mode, and copied to CPSR.Z on executing an exception return operation in FIQ mode.

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to FIQ mode, and copied to CPSR.C on executing an exception return operation in FIQ mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to FIQ mode, and copied to CPSR.V on executing an exception return operation in FIQ mode.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0 Taken from A32 state.

1 Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

1 Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0110 | Monitor |
| 0b0111 | Abort |
| 0b1010 | Hyp |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5501.

## Accessing the SPSR_fiq:

To access the SPSR_fiq:

```
MRS <Xt>, SPSR_fiq ; Read SPSR_fiq into Xt
MSR SPSR_fiq, <Xt> ; Write Xt to SPSR_fiq
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 100 | 0100 | 0011 | 011 |

### C5.2.21 SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to IRQ mode.

**Usage constraints**

This register is accessible as follows:

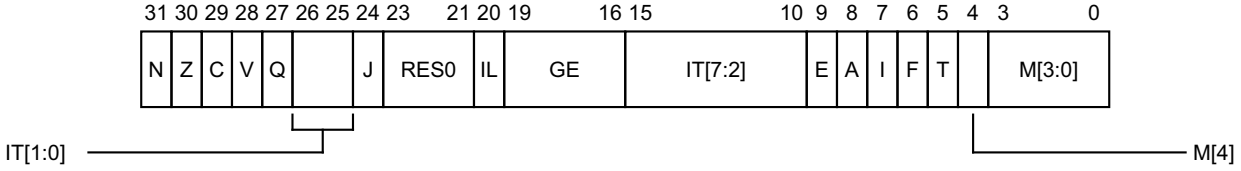
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register SPSR_irq is architecturally mapped to AArch32 System register SPSR_irq.



If EL1 does not support execution in AArch32, this register is RES0.

**Attributes**

SPSR_irq is a 32-bit register.

#### Field descriptions

The SPSR_irq bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to IRQ mode, and copied to CPSR.N on executing an exception return operation in IRQ mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to IRQ mode, and copied to CPSR.Z on executing an exception return operation in IRQ mode.

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to IRQ mode, and copied to CPSR.C on executing an exception return operation in IRQ mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to IRQ mode, and copied to CPSR.V on executing an exception return operation in IRQ mode.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

`0` Taken from A32 state.

`1` Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

`1` Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0110 | Monitor |
| 0b0111 | Abort |
| 0b1010 | Hyp |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5501.

## Accessing the SPSR_irq:

To access the SPSR_irq:

```
MRS <Xt>, SPSR_irq ; Read SPSR_irq into Xt
MSR SPSR_irq, <Xt> ; Write Xt to SPSR_irq
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### C5.2.22 SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Undefined mode.

**Usage constraints**

This register is accessible as follows:

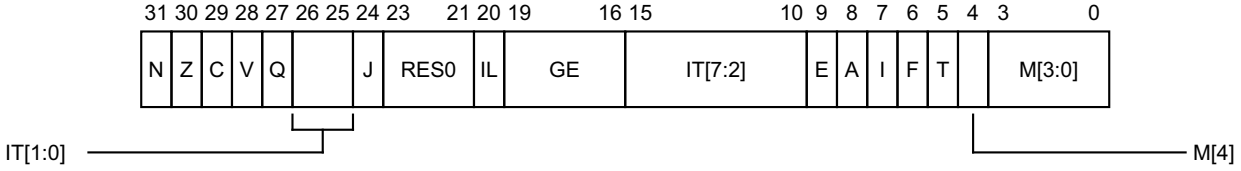
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register SPSR_und is architecturally mapped to AArch32 System register SPSR_und.



If EL1 does not support execution in AArch32, this register is RES0.

**Attributes**

SPSR_und is a 32-bit register.

## Field descriptions

The SPSR_und bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Undefined mode, and copied to CPSR.N on executing an exception return operation in Undefined mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Undefined mode, and copied to CPSR.Z on executing an exception return operation in Undefined mode.

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to Undefined mode, and copied to CPSR.C on executing an exception return operation in Undefined mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to Undefined mode, and copied to CPSR.V on executing an exception return operation in Undefined mode.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0 Taken from A32 state.

1 Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

1 Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0110 | Monitor |
| 0b0111 | Abort |
| 0b1010 | Hyp |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5501.

## Accessing the SPSR_und:

To access the SPSR_und:

```
MRS <Xt>, SPSR_und ; Read SPSR_und into Xt
MSR SPSR_und, <Xt> ; Write Xt to SPSR_und
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |

## C5.3 A64 system instructions for cache maintenance

The following sections define the cache maintenance system instructions in A64:

- *DC CISW, Data or unified Cache line Clean and Invalidate by Set/Way* on page C5-343.
- *DC CIVAC, Data or unified Cache line Clean and Invalidate by VA to PoC* on page C5-345.
- *DC CSW, Data or unified Cache line Clean by Set/Way* on page C5-346.
- *DC CVAC, Data or unified Cache line Clean by VA to PoC* on page C5-348.
- *DC CVAU, Data or unified Cache line Clean by VA to PoU* on page C5-349.
- *DC ISW, Data or unified Cache line Invalidate by Set/Way* on page C5-350.
- *DC IVAC, Data or unified Cache line Invalidate by VA to PoC* on page C5-352.
- *DC ZVA, Data Cache Zero by VA* on page C5-353.
- *IC IALLU, Instruction Cache Invalidate All to PoU* on page C5-355.
- *IC IALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable* on page C5-356.
- *IC IVAU, Instruction Cache line Invalidate by VA to PoU* on page C5-357.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.3.1 DC CISW, Data or unified Cache line Clean and Invalidate by Set/Way

The DC CISW characteristics are:

**Purpose**

Clean and Invalidate data cache by set/way.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - — No cache lines.
  - — A single arbitrary cache line.
  - — Multiple arbitrary cache lines.

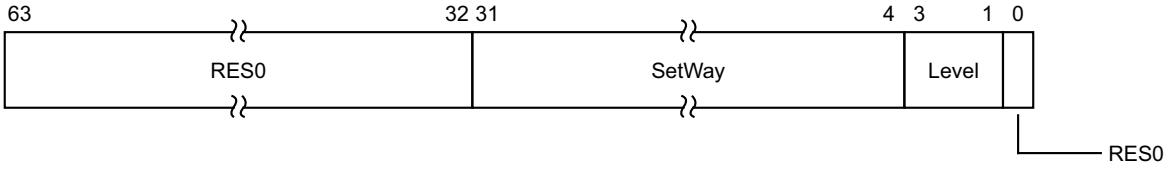
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TSW==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



AArch64 System operation DC CISW performs the same function as AArch32 System operation DCCISW.

**Attributes**

DC CISW is a 64-bit system operation.

#### Field descriptions

The DC CISW input value bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = $Log_2$(ASSOCIATIVITY), L = $Log_2$(LINELEN), B = (L + S), S = $Log_2$(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

### Performing the DC CISW operation:

To perform the DC CISW operation:

```
DC CISW, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 0111 | 1110 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.3.2 DC CIVAC, Data or unified Cache line Clean and Invalidate by VA to PoC

The DC CIVAC characteristics are:

**Purpose**

Clean and Invalidate data cache by address to Point of Coherency.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-WO | WO | WO | WO | WO | WO |

If EL0 access is enabled, this instruction is available at EL0 when the VA has read access permission, otherwise it causes a Permission Fault.

**Traps and Enables**

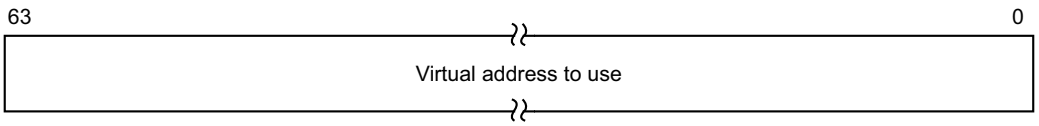
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TPC==1, Non-secure EL0 execution of this instruction is trapped to EL2.

If SCTLR_EL1.UCI==0, EL0 execution of this instruction is trapped to EL1.

**Configurations**



AArch64 System operation DC CIVAC performs the same function as AArch32 System operation DCCIMVAC.

**Attributes**

DC CIVAC is a 64-bit system operation.

#### Field descriptions

The DC CIVAC input value bit assignments are:

**Bits [63:0]**

Virtual address to use.

#### Performing the DC CIVAC operation:

To perform the DC CIVAC operation:

```
DC CIVAC, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 011 | 0111 | 1110 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.3.3 DC CSW, Data or unified Cache line Clean by Set/Way

The DC CSW characteristics are:

**Purpose**

Clean data cache by set/way.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

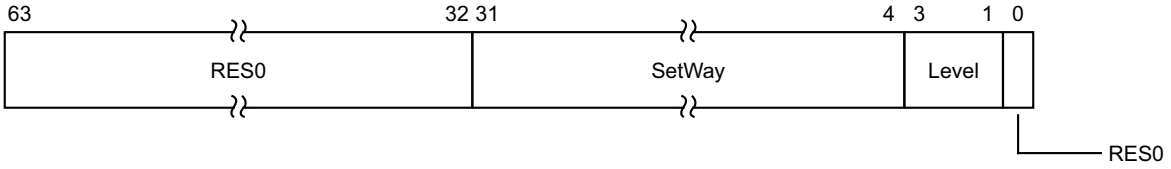
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TSW==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



AArch64 System operation DC CSW performs the same function as AArch32 System operation DCCSW.

**Attributes**

DC CSW is a 64-bit system operation.

#### Field descriptions

The DC CSW input value bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = $Log_2$(ASSOCIATIVITY), L = $Log_2$(LINELEN), B = (L + S), S = $Log_2$(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

### Performing the DC CSW operation:

To perform the DC CSW operation:

```
DC CSW, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 0111 | 1010 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.3.4 DC CVAC, Data or unified Cache line Clean by VA to PoC

The DC CVAC characteristics are:

**Purpose**

Clean data cache by address to Point of Coherency.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-WO | WO | WO | WO | WO | WO |

If EL0 access is enabled, this instruction is available at EL0 when the VA has read access permission, otherwise it causes a Permission Fault.

**Traps and Enables**

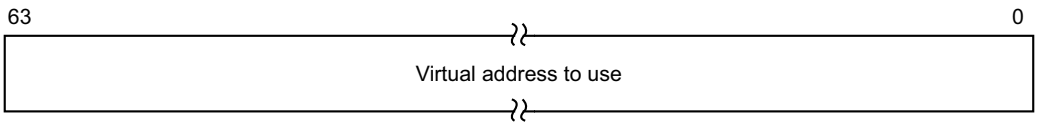
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TPC==1, Non-secure EL0 execution of this instruction is trapped to EL2.

If SCTLR_EL1.UCI==0, EL0 execution of this instruction is trapped to EL1.

**Configurations**



AArch64 System operation DC CVAC performs the same function as AArch32 System operation DCCMVAC.

**Attributes**

DC CVAC is a 64-bit system operation.

#### Field descriptions

The DC CVAC input value bit assignments are:

**Bits [63:0]**

Virtual address to use.

#### Performing the DC CVAC operation:

To perform the DC CVAC operation:

```
DC CVAC, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 011 | 0111 | 1010 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.3.5 DC CVAU, Data or unified Cache line Clean by VA to PoU

The DC CVAU characteristics are:

**Purpose**

Clean data cache by address to Point of Unification.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-WO | WO | WO | WO | WO | WO |

If EL0 access is enabled, this instruction is available at EL0 when the VA has read access permission, otherwise it causes a Permission Fault.

**Traps and Enables**

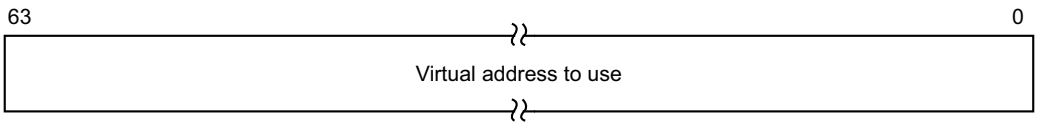
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TPU==1, Non-secure EL0 and EL1 execution of this instruction is trapped to EL2.

If SCTLR_EL1.UCI==0, EL0 execution of this instruction is trapped to EL1.

**Configurations**



AArch64 System operation DC CVAU performs the same function as AArch32 System operation DCCMVAU.

**Attributes**

DC CVAU is a 64-bit system operation.

#### Field descriptions

The DC CVAU input value bit assignments are:

**Bits [63:0]**

Virtual address to use.

#### Performing the DC CVAU operation:

To perform the DC CVAU operation:

```
DC CVAU, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 011 | 0111 | 1011 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.3.6 DC ISW, Data or unified Cache line Invalidate by Set/Way

The DC ISW characteristics are:

**Purpose**

Invalidate data cache by set/way.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

At EL1, this operation must operate as DC CISW if all of the following apply:

- EL2 is implemented.
- The value of HCR_EL2.SWIO is 1 or the value of HCR_EL2.VM is 1.
- The value of SCR_EL3.NS is 1 or EL3 is not implemented.

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

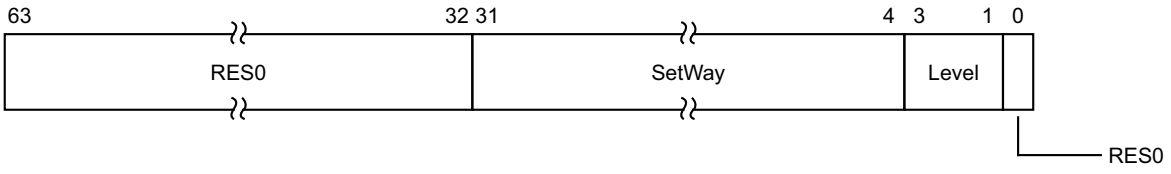
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TSW==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



AArch64 System operation DC ISW performs the same function as AArch32 System operation DCISW.

**Attributes**

DC ISW is a 64-bit system operation.

#### Field descriptions

The DC ISW input value bit assignments are:

**Bits [63:32]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = $Log_2$(ASSOCIATIVITY), L = $Log_2$(LINELEN), B = (L + S), S = $Log_2$(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

### Performing the DC ISW operation:

To perform the DC ISW operation:

```
DC ISW, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 0111 | 0110 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.3.7 DC IVAC, Data or unified Cache line Invalidate by VA to PoC

The DC IVAC characteristics are:

**Purpose**

Invalidate data cache by address to Point of Coherency.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

This instruction requires write access permission to the VA, otherwise it causes a Permission Fault.

When the instruction is executed, it can generate a watchpoint, which is prioritized in the same way as other watchpoints. If a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 1.

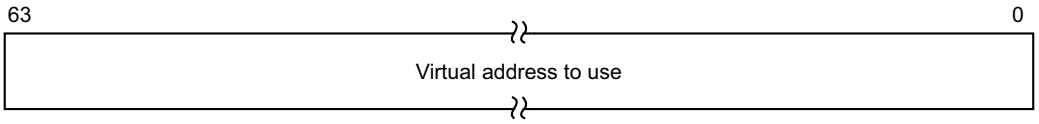
At EL1, this instruction must be performed as DC CIVAC if all of the following apply:

- EL2 is implemented.
- HCR_EL2.VM is set to 1.
- SCR_EL3.NS is set to 1 or EL3 is not implemented.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



AArch64 System operation DC IVAC performs the same function as AArch32 System operation DCIMVAC.

**Attributes**

DC IVAC is a 64-bit system operation.

#### Field descriptions

The DC IVAC input value bit assignments are:

**Bits [63:0]**

Virtual address to use.

#### Performing the DC IVAC operation:

To perform the DC IVAC operation:

```
DC IVAC, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 0111 | 0110 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.3.8 DC ZVA, Data Cache Zero by VA

The DC ZVA characteristics are:

**Purpose**

Zero data cache by address. Zeroes a naturally aligned block of N bytes, where the size of N is identified in DCZID_EL0.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-WO | WO | WO | WO | WO | WO |

When UNDEFINED, this instruction always takes the EL1 UNDEFINED exception.

When this instruction is executed, it can generate memory faults or watchpoints which are prioritised in the same way as other memory related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is not set.

If the memory region being zeroed is any type of Device memory, this instruction can give an alignment fault which is prioritised in the same way as other alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of Stores to each byte within the block being accessed, and so it:

- Will cause a Permission Fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

**Traps and Enables**

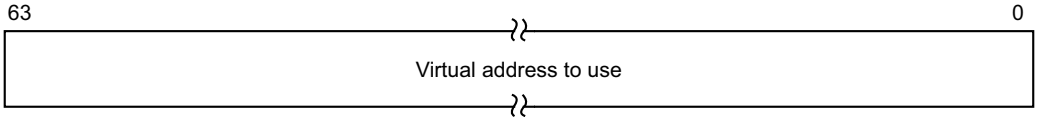
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TDZ==1, Non-secure EL0 and EL1 execution of this instruction is trapped to EL2.

If SCTLR_EL1.DZE==0, EL0 execution of this instruction is trapped to EL1.

**Configurations**



There are no configuration notes.

**Attributes**

DC ZVA is a 64-bit system operation.

#### Field descriptions

The DC ZVA input value bit assignments are:

**Bits [63:0]**

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Performing the DC ZVA operation:

To perform the DC ZVA operation:

```
DC ZVA, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 011 | 0111 | 0100 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.3.9 IC IALLU, Instruction Cache Invalidate All to PoU

The IC IALLU characteristics are:

**Purpose**

Invalidate all instruction caches to Point of Unification.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TPU==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

AArch64 System operation IC IALLU performs the same function as AArch32 System operation ICIALLU.

**Attributes**

IC IALLU is a 64-bit system operation.

#### Field descriptions

The IC IALLU operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the IC IALLU operation:

To perform the IC IALLU operation:

```
IC IALLU
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 0111 | 0101 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.3.10 IC IALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The IC IALLUIS characteristics are:

**Purpose**

Invalidate all instruction caches in Inner Shareable domain to Point of Unification.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TPU==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

AArch64 System operation IC IALLUIS performs the same function as AArch32 System operation ICIALLUIS.

**Attributes**

IC IALLUIS is a 64-bit system operation.

#### Field descriptions

The IC IALLUIS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the IC IALLUIS operation:

To perform the IC IALLUIS operation:

```
IC IALLUIS
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 0111 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.3.11 IC IVAU, Instruction Cache line Invalidate by VA to PoU

The IC IVAU characteristics are:

**Purpose**

Invalidate instruction cache by address to Point of Unification.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-WO | WO | WO | WO | WO | WO |

If EL0 access is enabled, this instruction is available at EL0 when the VA has read access permission. It is IMPLEMENTATION DEFINED whether executing this instruction at EL0 causes a Permission Fault if the VA does not have read access permission at EL0.

**Traps and Enables**

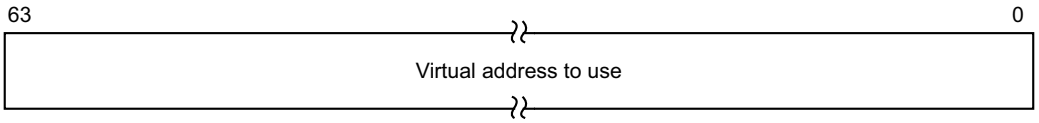
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TPU==1, Non-secure EL0 and EL1 execution of this instruction is trapped to EL2.

If SCTLR_EL1.UCI==0, EL0 execution of this instruction is trapped to EL1.

**Configurations**



AArch64 System operation IC IVAU performs the same function as AArch32 System operation ICIMVAU.

**Attributes**

IC IVAU is a 64-bit system operation.

#### Field descriptions

The IC IVAU input value bit assignments are:

**Bits [63:0]**

Virtual address to use.

#### Performing the IC IVAU operation:

To perform the IC IVAU operation:

```
IC IVAU, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 011 | 0111 | 0101 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

## C5.4 A64 system instructions for address translation

The following sections define the address translation system instructions in A64:

- *AT S12E0R, Address Translate Stages 1 and 2 EL0 Read* on page C5-359.
- *AT S12E0W, Address Translate Stages 1 and 2 EL0 Write* on page C5-360.
- *AT S12E1R, Address Translate Stages 1 and 2 EL1 Read* on page C5-361.
- *AT S12E1W, Address Translate Stages 1 and 2 EL1 Write* on page C5-362.
- *AT S1E0R, Address Translate Stage 1 EL0 Read* on page C5-363.
- *AT S1E0W, Address Translate Stage 1 EL0 Write* on page C5-364.
- *AT S1E1R, Address Translate Stage 1 EL1 Read* on page C5-365.
- *AT S1E1W, Address Translate Stage 1 EL1 Write* on page C5-366.
- *AT S1E2R, Address Translate Stage 1 EL2 Read* on page C5-367.
- *AT S1E2W, Address Translate Stage 1 EL2 Write* on page C5-368.
- *AT S1E3R, Address Translate Stage 1 EL3 Read* on page C5-369.
- *AT S1E3W, Address Translate Stage 1 EL3 Write* on page C5-370.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.4.1 AT S12E0R, Address Translate Stages 1 and 2 EL0 Read

The AT S12E0R characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for EL0, with permissions as if reading from the given virtual address.

**Usage constraints**

This operation can be performed at the following exception levels:

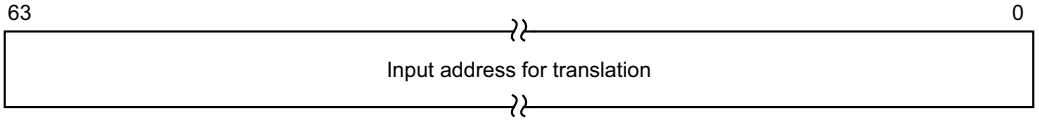
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL2 does not exist, or stage 2 translation is disabled, or the instruction is executed at EL3 when the value of SCR_EL3.NS is 0, this operation executes as AT S1E0R.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S12E0R is a 64-bit system operation.

#### Field descriptions

The AT S12E0R input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S12E0R operation:

To perform the AT S12E0R operation:

```
AT S12E0R, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 0111 | 1000 | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.4.2 AT S12E0W, Address Translate Stages 1 and 2 EL0 Write

The AT S12E0W characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for EL0, with permissions as if writing to the given virtual address.

**Usage constraints**

This operation can be performed at the following exception levels:

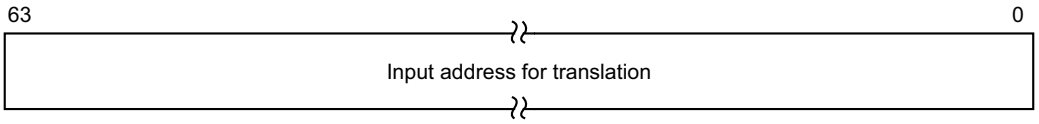
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL2 does not exist, or stage 2 translation is disabled, or the instruction is executed at EL3 when the value of SCR_EL3.NS is 0, this operation executes as AT S1E0W.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S12E0W is a 64-bit system operation.

#### Field descriptions

The AT S12E0W input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S12E0W operation:

To perform the AT S12E0W operation:

```
AT S12E0W, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 0111 | 1000 | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.4.3 AT S12E1R, Address Translate Stages 1 and 2 EL1 Read

The AT S12E1R characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for EL1, with permissions as if reading from the given virtual address.

**Usage constraints**

This operation can be performed at the following exception levels:

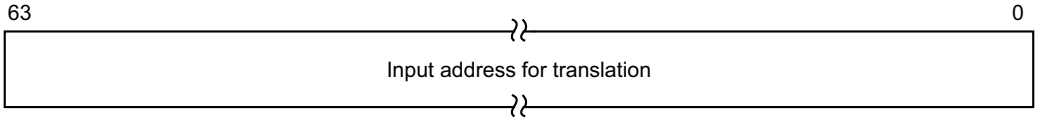
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL2 does not exist, or stage 2 translation is disabled, or the instruction is executed at EL3 when the value of SCR_EL3.NS is 0, this operation executes as AT S1E1R.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S12E1R is a 64-bit system operation.

#### Field descriptions

The AT S12E1R input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S12E1R operation:

To perform the AT S12E1R operation:

```
AT S12E1R, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 0111 | 1000 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.4.4 AT S12E1W, Address Translate Stages 1 and 2 EL1 Write

The AT S12E1W characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for EL1, with permissions as if writing to the given virtual address.

**Usage constraints**

This operation can be performed at the following exception levels:

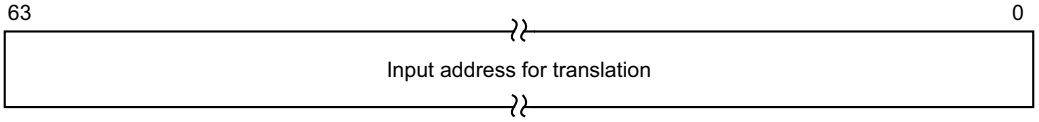
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL2 does not exist, or stage 2 translation is disabled, or the instruction is executed at EL3 when the value of SCR_EL3.NS is 0, this operation executes as AT S1E1W.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S12E1W is a 64-bit system operation.

#### Field descriptions

The AT S12E1W input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S12E1W operation:

To perform the AT S12E1W operation:

```
AT S12E1W, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 0111 | 1000 | 101 |

### C5.4.5 AT S1E0R, Address Translate Stage 1 EL0 Read

The AT S1E0R characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL0, with permissions as if reading from the given virtual address.

**Usage constraints**

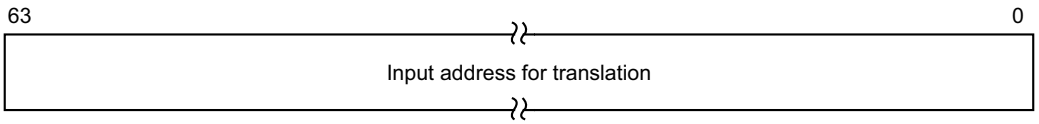
This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S1E0R is a 64-bit system operation.

#### Field descriptions

The AT S1E0R input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S1E0R operation:

To perform the AT S1E0R operation:

```
AT S1E0R, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 0111 | 1000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### C5.4.6 AT S1E0W, Address Translate Stage 1 EL0 Write

The AT S1E0W characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL0, with permissions as if writing to the given virtual address.

**Usage constraints**

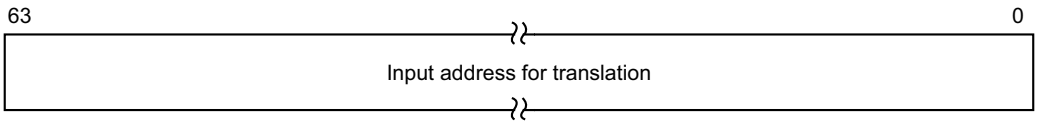
This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S1E0W is a 64-bit system operation.

#### Field descriptions

The AT S1E0W input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S1E0W operation:

To perform the AT S1E0W operation:

```
AT S1E0W, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 0111 | 1000 | 011 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.4.7 AT S1E1R, Address Translate Stage 1 EL1 Read

The AT S1E1R characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL1, with permissions as if reading from the given virtual address.

**Usage constraints**

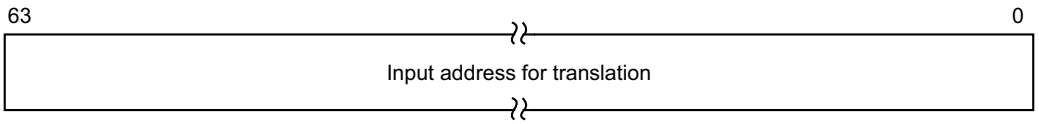
This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S1E1R is a 64-bit system operation.

#### Field descriptions

The AT S1E1R input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S1E1R operation:

To perform the AT S1E1R operation:

```
AT S1E1R, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 0111 | 1000 | 000 |

Non-Confidential - Beta

### C5.4.8 AT S1E1W, Address Translate Stage 1 EL1 Write

The AT S1E1W characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL1, with permissions as if writing to the given virtual address.

**Usage constraints**

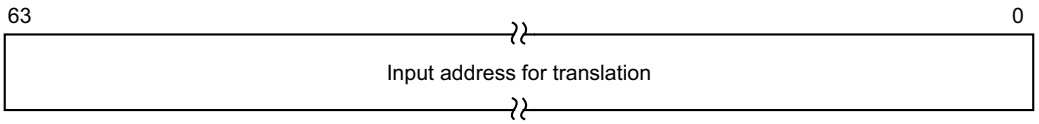
This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S1E1W is a 64-bit system operation.

#### Field descriptions

The AT S1E1W input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S1E1W operation:

To perform the AT S1E1W operation:

```
AT S1E1W, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 0111 | 1000 | 001 |

### C5.4.9 AT S1E2R, Address Translate Stage 1 EL2 Read

The AT S1E2R characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL2, with permissions as if reading from the given virtual address.

**Usage constraints**

This operation can be performed at the following exception levels:

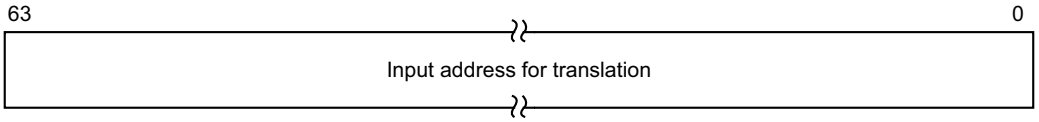
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | - |

Performing this operation from EL3 is UNDEFINED if EL2 does not exist.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S1E2R is a 64-bit system operation.

#### Field descriptions

The AT S1E2R input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S1E2R operation:

To perform the AT S1E2R operation:

```
AT S1E2R, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 0111 | 1000 | 000 |

### C5.4.10 AT S1E2W, Address Translate Stage 1 EL2 Write

The AT S1E2W characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL2, with permissions as if writing to the given virtual address.

**Usage constraints**

This operation can be performed at the following exception levels:

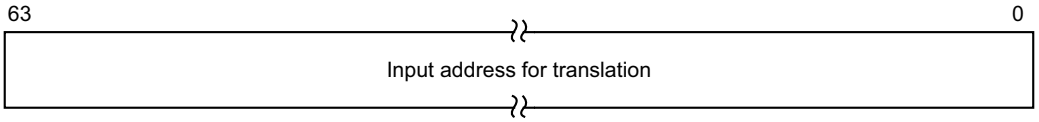
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | - |

Performing this operation from EL3 is UNDEFINED if EL2 does not exist.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S1E2W is a 64-bit system operation.

#### Field descriptions

The AT S1E2W input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S1E2W operation:

To perform the AT S1E2W operation:

```
AT S1E2W, <Xt>
```

The operation is encoded as follows:

### C5.4.11 AT S1E3R, Address Translate Stage 1 EL3 Read

The AT S1E3R characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL3, with permissions as if reading from the given virtual address.

**Usage constraints**

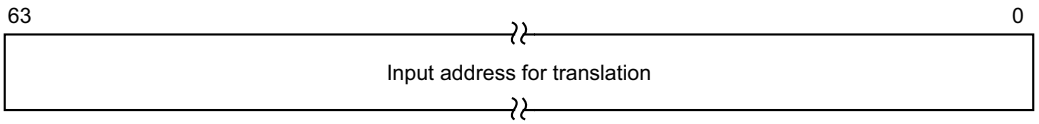
This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | WO | WO |

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S1E3R is a 64-bit system operation.

#### Field descriptions

The AT S1E3R input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S1E3R operation:

### C5.4.12 AT S1E3W, Address Translate Stage 1 EL3 Write

The AT S1E3W characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL3, with permissions as if writing to the given virtual address.

**Usage constraints**

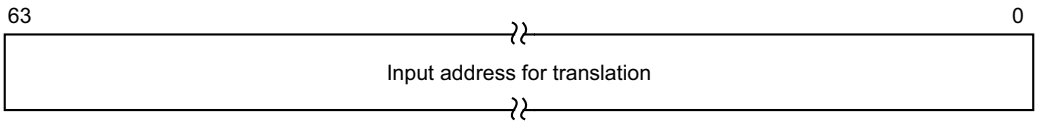
This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | WO | WO |

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

AT S1E3W is a 64-bit system operation.

#### Field descriptions

The AT S1E3W input value bit assignments are:

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

#### Performing the AT S1E3W operation:

To perform the AT S1E3W operation:

```
AT S1E3W, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |

## C5.5 A64 system instructions for TLB maintenance

The following sections define the TLB maintenance system instructions in A64:

- *TLBI ALLE1, TLB Invalidate All, EL1* on page C5-372.
- *TLBI ALLE1IS, TLB Invalidate All, EL1, Inner Shareable* on page C5-373.
- *TLBI ALLE2, TLB Invalidate All, EL2* on page C5-374.
- *TLBI ALLE2IS, TLB Invalidate All, EL2, Inner Shareable* on page C5-375.
- *TLBI ALLE3, TLB Invalidate All, EL3* on page C5-376.
- *TLBI ALLE3IS, TLB Invalidate All, EL3, Inner Shareable* on page C5-377.
- *TLBI ASIDE1, TLB Invalidate by ASID, EL1* on page C5-378.
- *TLBI ASIDE1IS, TLB Invalidate by ASID, EL1, Inner Shareable* on page C5-380.
- *TLBI IPAS2E1, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1* on page C5-382.
- *TLBI IPAS2E1IS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable* on page C5-383.
- *TLBI IPAS2LE1, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1* on page C5-385.
- *TLBI IPAS2LE1IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable* on page C5-386.
- *TLBI VAAE1, TLB Invalidate by VA, All ASID, EL1* on page C5-388.
- *TLBI VAAE1IS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable* on page C5-390.
- *TLBI VAALE1, TLB Invalidate by VA, All ASID, Last level, EL1* on page C5-392.
- *TLBI VAALE1IS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable* on page C5-394.
- *TLBI VAE1, TLB Invalidate by VA, EL1* on page C5-396.
- *TLBI VAE1IS, TLB Invalidate by VA, EL1, Inner Shareable* on page C5-398.
- *TLBI VAE2, TLB Invalidate by VA, EL2* on page C5-400.
- *TLBI VAE2IS, TLB Invalidate by VA, EL2, Inner Shareable* on page C5-402.
- *TLBI VAE3, TLB Invalidate by VA, EL3* on page C5-404.
- *TLBI VAE3IS, TLB Invalidate by VA, EL3, Inner Shareable* on page C5-406.
- *TLBI VALE1, TLB Invalidate by VA, Last level, EL1* on page C5-408.
- *TLBI VALE1IS, TLB Invalidate by VA, Last level, EL1, Inner Shareable* on page C5-410.
- *TLBI VALE2, TLB Invalidate by VA, Last level, EL2* on page C5-412.
- *TLBI VALE2IS, TLB Invalidate by VA, Last level, EL2, Inner Shareable* on page C5-414.
- *TLBI VALE3, TLB Invalidate by VA, Last level, EL3* on page C5-416.
- *TLBI VALE3IS, TLB Invalidate by VA, Last level, EL3, Inner Shareable* on page C5-418.
- *TLBI VMALLE1, TLB Invalidate by VMID, All at stage 1, EL1* on page C5-420.
- *TLBI VMALLE1IS, TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable* on page C5-421.
- *TLBI VMALLS12E1, TLB Invalidate by VMID, All at Stage 1 and 2, EL1* on page C5-422.
- *TLBI VMALLS12E1IS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable* on page C5-423.

For more information about these instructions see *TLB maintenance instructions* on page D4-1839. In particular, for the full description of the scope of each instruction see *Scope of the A64 TLB maintenance instructions* on page D4-1842.

Non-Confidential - Beta

### C5.5.1 TLBI ALLE1, TLB Invalidate All, EL1

The TLBI ALLE1 characteristics are:

**Purpose**

Invalidate all EL1&0 regime stage 1 and 2 TLB entries.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see ALL.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE1 is a 64-bit system operation.

#### Field descriptions

The TLBI ALLE1 operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBI ALLE1 operation:

To perform the TLBI ALLE1 operation:

```
TLBI ALLE1
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 1000 | 0111 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.5.2 TLBI ALLE1IS, TLB Invalidate All, EL1, Inner Shareable

The TLBI ALLE1IS characteristics are:

**Purpose**

Invalidate all EL1&0 regime stage 1 and 2 TLB entries on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see ALL.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE1IS is a 64-bit system operation.

#### Field descriptions

The TLBI ALLE1IS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBI ALLE1IS operation:

To perform the TLBI ALLE1IS operation:

```
TLBI ALLE1IS
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 1000 | 0011 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.5.3 TLBI ALLE2, TLB Invalidate All, EL2

The TLBI ALLE2 characteristics are:

**Purpose**

Invalidate all EL2 regime stage 1 TLB entries.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | - |

Performing this operation from EL3 is UNDEFINED if EL2 does not exist.

For details of the scope of this instruction see ALL.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE2 is a 64-bit system operation.

#### Field descriptions

The TLBI ALLE2 operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBI ALLE2 operation:

To perform the TLBI ALLE2 operation:

```
TLBI ALLE2
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 1000 | 0111 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.5.4 TLBI ALLE2IS, TLB Invalidate All, EL2, Inner Shareable

The TLBI ALLE2IS characteristics are:

**Purpose**

Invalidate all EL2 regime stage 1 TLB entries on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | - |

Performing this operation from EL3 is UNDEFINED if EL2 does not exist.

For details of the scope of this instruction see ALL.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE2IS is a 64-bit system operation.

#### Field descriptions

The TLBI ALLE2IS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBI ALLE2IS operation:

To perform the TLBI ALLE2IS operation:

```
TLBI ALLE2IS
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 1000 | 0011 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.5.5 TLBI ALLE3, TLB Invalidate All, EL3

The TLBI ALLE3 characteristics are:

**Purpose**

Invalidate all EL3 regime stage 1 TLB entries.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | WO | WO |

For details of the scope of this instruction see ALL.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE3 is a 64-bit system operation.

#### Field descriptions

The TLBI ALLE3 operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBI ALLE3 operation:

To perform the TLBI ALLE3 operation:

```
TLBI ALLE3
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 110 | 1000 | 0111 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.5.6 TLBI ALLE3IS, TLB Invalidate All, EL3, Inner Shareable

The TLBI ALLE3IS characteristics are:

**Purpose**

Invalidate all EL3 regime stage 1 TLB entries on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | WO | WO |

For details of the scope of this instruction see ALL.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE3IS is a 64-bit system operation.

#### Field descriptions

The TLBI ALLE3IS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBI ALLE3IS operation:

To perform the TLBI ALLE3IS operation:

```
TLBI ALLE3IS
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 110 | 1000 | 0011 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.5.7 TLBI ASIDE1, TLB Invalidate by ASID, EL1

The TLBI ASIDE1 characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 1 TLB entries for the given ASID and the current VMID.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see ASID.

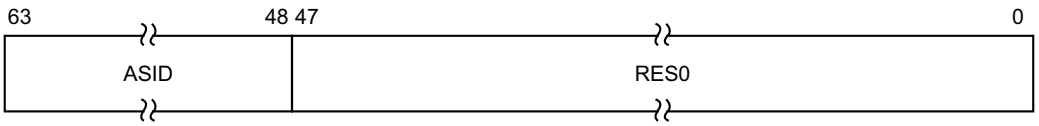
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI ASIDE1 is a 64-bit system operation.

#### Field descriptions

The TLBI ASIDE1 input value bit assignments are:

**ASID, bits [63:48]**

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this operation.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are considered RES0 and must be written to 0 by software performing the TLB maintenance.

**Bits [47:0]**

Reserved, RES0.

#### Performing the TLBI ASIDE1 operation:

To perform the TLBI ASIDE1 operation:

```
TLBI ASIDE1, <Xt>
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 1000 | 0111 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.5.8 TLBI ASIDE1IS, TLB Invalidate by ASID, EL1, Inner Shareable

The TLBI ASIDE1IS characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 1 TLB entries for the given ASID and the current VMID on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see ASID.

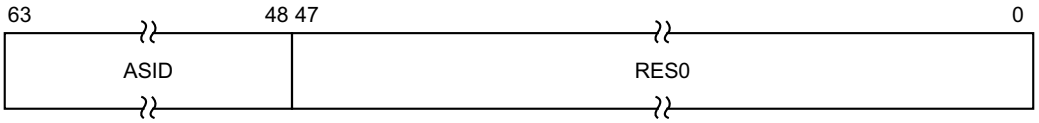
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI ASIDE1IS is a 64-bit system operation.

#### Field descriptions

The TLBI ASIDE1IS input value bit assignments are:

**ASID, bits [63:48]**

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this operation.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are considered RES0 and must be written to 0 by software performing the TLB maintenance.

**Bits [47:0]**

Reserved, RES0.

### C5.5.9 TLBI IPAS2E1, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI IPAS2E1 characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 2 TLB entries for the given IPA and the current VMID.

For details of the scope of this instruction see IPAS2.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

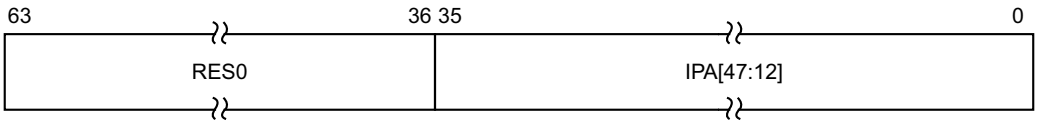
If SCR_EL3.NS==0, or EL2 is not implemented, this instruction is a NOP.

This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI IPAS2E1 is a 64-bit system operation.

#### Field descriptions

The TLBI IPAS2E1 input value bit assignments are:

**Bits [63:36]**

Reserved, RES0.

**IPA[47:12], bits [35:0]**

Bits[47:12] of the intermediate physical address to match.

#### Performing the TLBI IPAS2E1 operation:

To perform the TLBI IPAS2E1 operation:

```
TLBI IPAS2E1, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 1000 | 0100 | 001 |

Non-Confidential - Beta

### C5.5.10 TLBI IPAS2E1IS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI IPAS2E1IS characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 2 TLB entries for the given IPA and the current VMID on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see IPAS2.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

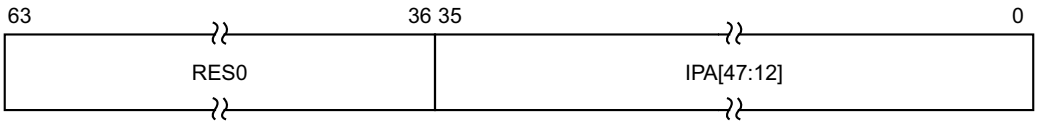
If SCR_EL3.NS==0, or EL2 is not implemented, this instruction is a NOP.

This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI IPAS2E1IS is a 64-bit system operation.

#### Field descriptions

The TLBI IPAS2E1IS input value bit assignments are:

**Bits [63:36]**

Reserved, RES0.

**IPA[47:12], bits [35:0]**

Bits[47:12] of the intermediate physical address to match.

#### Performing the TLBI IPAS2E1IS operation:

To perform the TLBI IPAS2E1IS operation:

### C5.5.11 TLBI IPAS2LE1, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI IPAS2LE1 characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 2 TLB entries for the last level of translation, the given IPA, and the current VMID.

For details of the scope of this instruction see IPAS2L.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

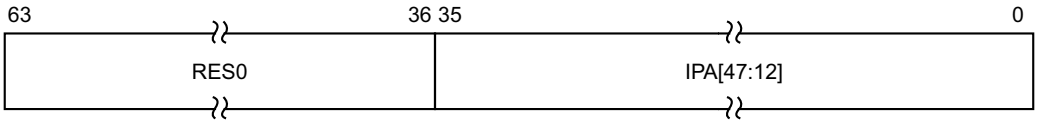
If SCR_EL3.NS==0, or EL2 is not implemented, this instruction is a NOP.

This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI IPAS2LE1 is a 64-bit system operation.

#### Field descriptions

The TLBI IPAS2LE1 input value bit assignments are:

**Bits [63:36]**

Reserved, RES0.

**IPA[47:12], bits [35:0]**

Bits[47:12] of the intermediate physical address to match.

#### Performing the TLBI IPAS2LE1 operation:

### C5.5.12 TLBI IPAS2LE1IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI IPAS2LE1IS characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 2 TLB entries for the last level of translation, the given IPA, and the current VMID, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see IPAS2L.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

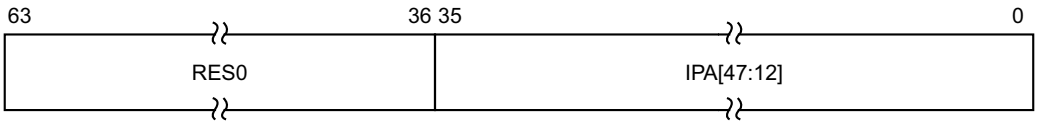
If SCR_EL3.NS==0, or EL2 is not implemented, this instruction is a NOP.

This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI IPAS2LE1IS is a 64-bit system operation.

#### Field descriptions

The TLBI IPAS2LE1IS input value bit assignments are:

**Bits [63:36]**

Reserved, RES0.

**IPA[47:12], bits [35:0]**

Bits[47:12] of the intermediate physical address to match.

#### Performing the TLBI IPAS2LE1IS operation:

To perform the TLBI IPAS2LE1IS operation:

```
TLBI IPAS2LE1IS, <Xt>
```

### C5.5.13 TLBI VAAE1, TLB Invalidate by VA, All ASID, EL1

The TLBI VAAE1 characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 1 TLB entries for the given VA and the current VMID.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see VAA.

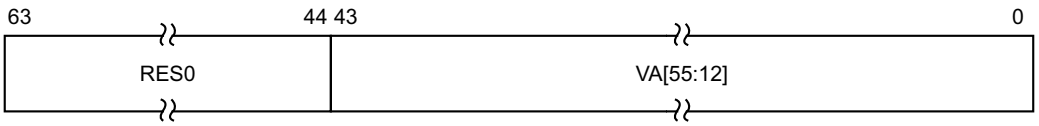
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VAAE1 is a 64-bit system operation.

#### Field descriptions

The TLBI VAAE1 input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this operation, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Performing the TLBI VAAE1 operation:

To perform the TLBI VAAE1 operation:

```
TLBI VAAE1, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 1000 | 0111 | 011 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.5.14 TLBI VAAE1IS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 1 TLB entries for the given VA and the current VMID on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see VAA.

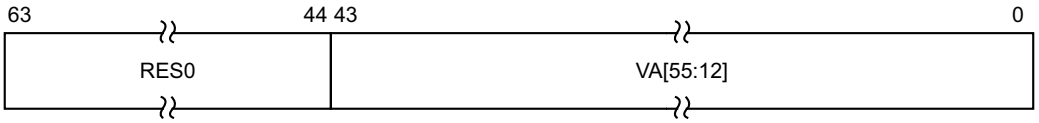
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VAAE1IS is a 64-bit system operation.

#### Field descriptions

The TLBI VAAE1IS input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this operation, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

### C5.5.15 TLBI VAALE1, TLB Invalidate by VA, All ASID, Last level, EL1

The TLBI VAALE1 characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 1 TLB entries for the last level of translation table walk, the given VA, and the current VMID.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see VAAL.

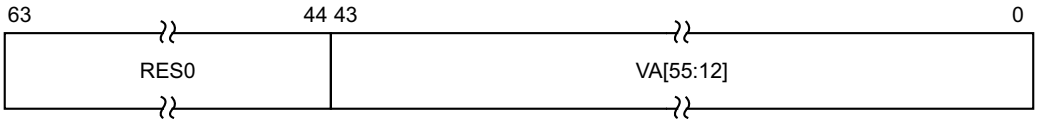
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VAALE1 is a 64-bit system operation.

#### Field descriptions

The TLBI VAALE1 input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this operation, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

### C5.5.16 TLBI VAALE1IS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAALE1IS characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 1 TLB entries for the last level of translation table walk, the given VA, and the current VMID, on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see VAAL.

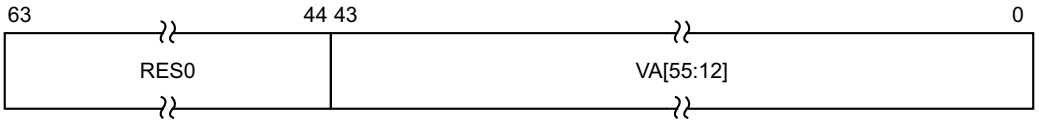
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VAALE1IS is a 64-bit system operation.

#### Field descriptions

The TLBI VAALE1IS input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this operation, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

### C5.5.17 TLBI VAE1, TLB Invalidate by VA, EL1

The TLBI VAE1 characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 1 TLB entries for the given VA and ASID and the current VMID.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see VA.

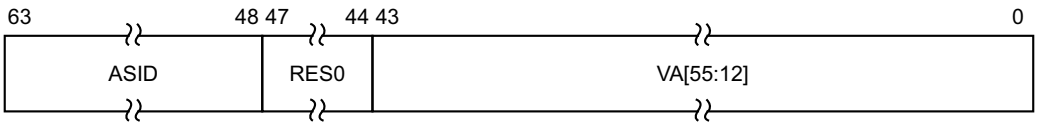
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VAE1 is a 64-bit system operation.

#### Field descriptions

The TLBI VAE1 input value bit assignments are:

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are considered RES0 and must be written to 0 by software performing the TLB maintenance.

**Bits [47:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Performing the TLBI VAE1 operation:

To perform the TLBI VAE1 operation:

```
TLBI VAE1, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|

### C5.5.18 TLBI VAE1IS, TLB Invalidate by VA, EL1, Inner Shareable

The TLBI VAE1IS characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 1 TLB entries for the given VA and ASID, and the current VMID, on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see VA.

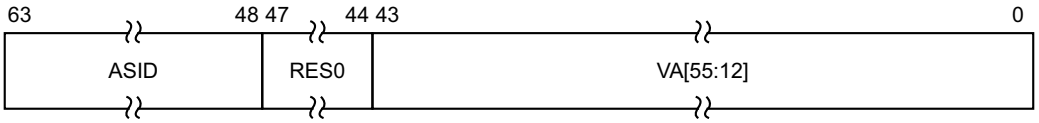
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VAE1IS is a 64-bit system operation.

#### Field descriptions

The TLBI VAE1IS input value bit assignments are:

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are considered RES0 and must be written to 0 by software performing the TLB maintenance.

**Bits [47:44]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### C5.5.19 TLBI VAE2, TLB Invalidate by VA, EL2

The TLBI VAE2 characteristics are:

**Purpose**

Invalidate EL2 regime stage 1 TLB entries for the given VA.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | - |

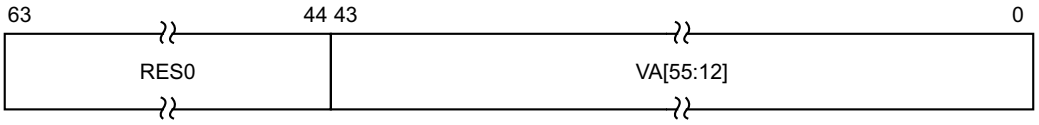
Performing this operation from EL3 is UNDEFINED if EL2 does not exist.

For details of the scope of this instruction see VA.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VAE2 is a 64-bit system operation.

#### Field descriptions

The TLBI VAE2 input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### C5.5.20 TLBI VAE2IS, TLB Invalidate by VA, EL2, Inner Shareable

The TLBI VAE2IS characteristics are:

**Purpose**

Invalidate EL2 regime stage 1 TLB entries for the given VA on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | - |

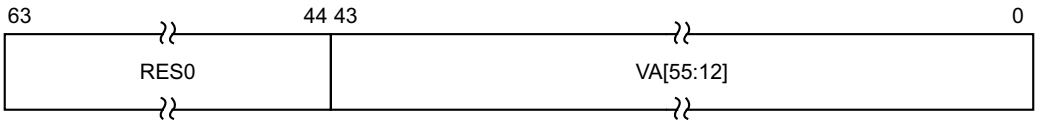
Performing this operation from EL3 is UNDEFINED if EL2 does not exist.

For details of the scope of this instruction see VA.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VAE2IS is a 64-bit system operation.

#### Field descriptions

The TLBI VAE2IS input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### C5.5.21 TLBI VAE3, TLB Invalidate by VA, EL3

The TLBI VAE3 characteristics are:

**Purpose**

Invalidate EL3 regime stage 1 TLB entries for the given VA.

**Usage constraints**

This operation can be performed at the following exception levels:

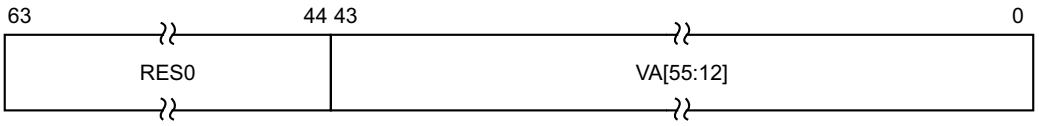
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | WO | WO |

For details of the scope of this instruction see VA.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VAE3 is a 64-bit system operation.

#### Field descriptions

The TLBI VAE3 input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### C5.5.22 TLBI VAE3IS, TLB Invalidate by VA, EL3, Inner Shareable

The TLBI VAE3IS characteristics are:

**Purpose**

Invalidate EL3 regime stage 1 TLB entries for the given VA on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

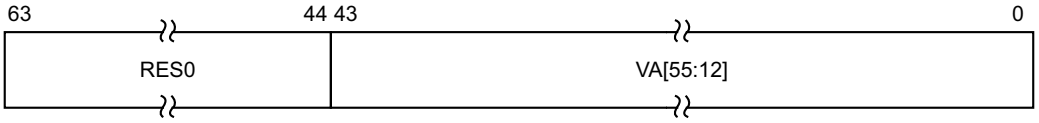
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | WO | WO |

For details of the scope of this instruction see VA.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VAE3IS is a 64-bit system operation.

#### Field descriptions

The TLBI VAE3IS input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### C5.5.23 TLBI VALE1, TLB Invalidate by VA, Last level, EL1

The TLBI VALE1 characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 1 TLB entries for the last level of translation table walk, the given VA and ASID, and the current VMID.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see VAL.

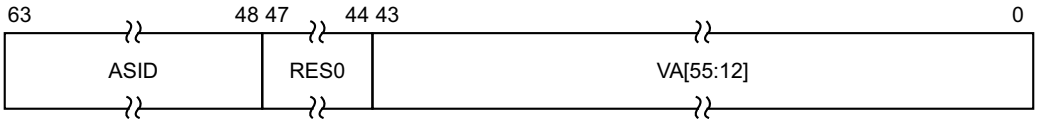
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VALE1 is a 64-bit system operation.

#### Field descriptions

The TLBI VALE1 input value bit assignments are:

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are considered RES0 and must be written to 0 by software performing the TLB maintenance.

**Bits [47:44]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Performing the TLBI VALE1 operation:

To perform the TLBI VALE1 operation:

```
TLBI VALE1, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 1000 | 0111 | 101 |

### C5.5.24 TLBI VALE1IS, TLB Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI VALE1IS characteristics are:

**Purpose**

Invalidate EL1&0 regime stage 1 TLB entries for the last level of translation table walk, the given VA and ASID, and the current VMID, on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see VAL.

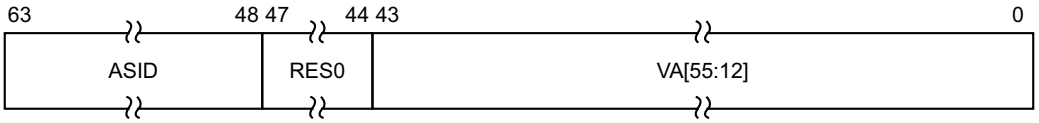
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VALE1IS is a 64-bit system operation.

#### Field descriptions

The TLBI VALE1IS input value bit assignments are:

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are considered RES0 and must be written to 0 by software performing the TLB maintenance.

**Bits [47:44]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Performing the TLBI VALE1IS operation:

To perform the TLBI VALE1IS operation:

```
TLBI VALE1IS, <Xt>
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |

### C5.5.25 TLBI VALE2, TLB Invalidate by VA, Last level, EL2

The TLBI VALE2 characteristics are:

**Purpose**

Invalidate EL2 regime stage 1 TLB entries for the last level of translation table walk and the given VA.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | - |

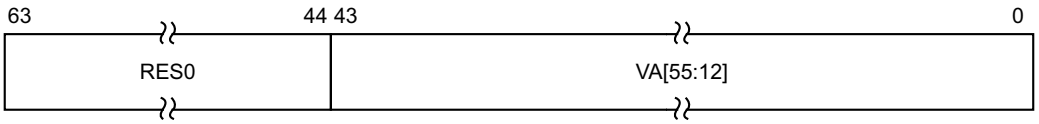
Performing this operation from EL3 is UNDEFINED if EL2 does not exist.

For details of the scope of this instruction see VAL.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VALE2 is a 64-bit system operation.

#### Field descriptions

The TLBI VALE2 input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### C5.5.26 TLBI VALE2IS, TLB Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI VALE2IS characteristics are:

**Purpose**

Invalidate EL2 regime stage 1 TLB entries for the last level of translation table walk and the given VA on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | - |

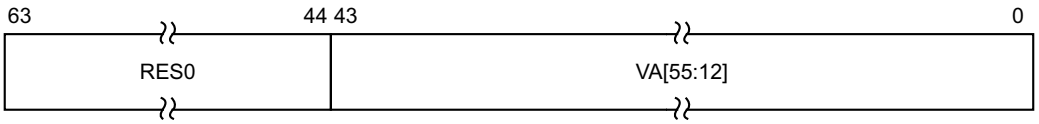
Performing this operation from EL3 is UNDEFINED if EL2 does not exist.

For details of the scope of this instruction see VAL.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VALE2IS is a 64-bit system operation.

#### Field descriptions

The TLBI VALE2IS input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### C5.5.27 TLBI VALE3, TLB Invalidate by VA, Last level, EL3

The TLBI VALE3 characteristics are:

**Purpose**

Invalidate EL3 regime stage 1 TLB entries for the last level of translation table walk and the given VA.

**Usage constraints**

This operation can be performed at the following exception levels:

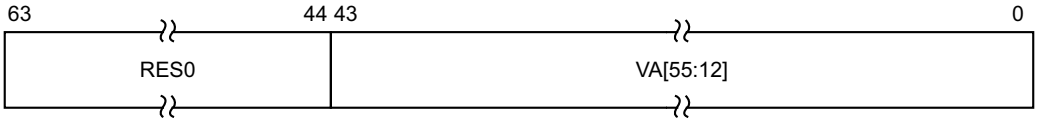
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | WO | WO |

For details of the scope of this instruction see VAL.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VALE3 is a 64-bit system operation.

#### Field descriptions

The TLBI VALE3 input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### C5.5.28 TLBI VALE3IS, TLB Invalidate by VA, Last level, EL3, Inner Shareable

The TLBI VALE3IS characteristics are:

**Purpose**

Invalidate EL3 regime stage 1 TLB entries for the last level of translation table walk and the given VA on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

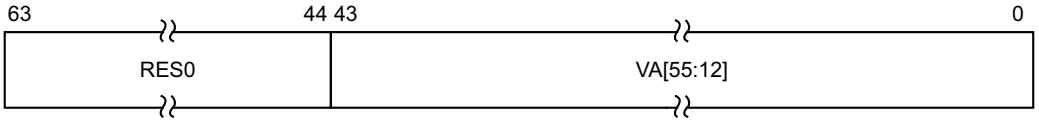
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | WO | WO |

For details of the scope of this instruction see VAL.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**



There are no configuration notes.

**Attributes**

TLBI VALE3IS is a 64-bit system operation.

#### Field descriptions

The TLBI VALE3IS input value bit assignments are:

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### C5.5.29 TLBI VMALLE1, TLB Invalidate by VMID, All at stage 1, EL1

The TLBI VMALLE1 characteristics are:

**Purpose**

Invalidate all EL1&0 regime stage 1 TLB entries for the current VMID.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see VMALL.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VMALLE1 is a 64-bit system operation.

#### Field descriptions

The TLBI VMALLE1 operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBI VMALLE1 operation:

To perform the TLBI VMALLE1 operation:

```
TLBI VMALLE1
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 1000 | 0111 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.5.30 TLBI VMALLE1IS, TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable

The TLBI VMALLE1IS characteristics are:

**Purpose**

Invalidate all EL1&0 regime stage 1 TLB entries for the current VMID on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

If EL3 is implemented, the value of SCR_EL3.NS determines whether the instruction invalidates the translations that are associated with Secure address space, or invalidates the translations associated with the Non-secure address space.

For details of the scope of this instruction see VMALL.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VMALLE1IS is a 64-bit system operation.

#### Field descriptions

The TLBI VMALLE1IS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBI VMALLE1IS operation:

To perform the TLBI VMALLE1IS operation:

```
TLBI VMALLE1IS
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 000 | 1000 | 0011 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### C5.5.31 TLBI VMALLS12E1, TLB Invalidate by VMID, All at Stage 1 and 2, EL1

The TLBI VMALLS12E1 characteristics are:

**Purpose**

Invalidate all EL1&0 regime stage 1 and 2 TLB entries for the current VMID.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If this instruction is executed at EL3 when the value of SCR_EL3.NS is 0, this instruction executes as a TLBI VMALLE1.

For details of the scope of this instruction see VMALLS12.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VMALLS12E1 is a 64-bit system operation.

#### Field descriptions

The TLBI VMALLS12E1 operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBI VMALLS12E1 operation:

To perform the TLBI VMALLS12E1 operation:

```
TLBI VMALLS12E1
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 1000 | 0111 | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C5.5.32 TLBI VMALLS12E1IS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable

The TLBI VMALLS12E1IS characteristics are:

**Purpose**

Invalidate all EL1&0 regime stage 1 and 2 TLB entries for the current VMID on all PEs in the same Inner Shareable domain.

**Usage constraints**

This operation can be performed at the following exception levels:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If this instruction is executed at EL3 when the value of SCR_EL3.NS is 0, this instruction executes as a TLBI VMALLE1IS.

For details of the scope of this instruction see VMALLS12.

**Traps and Enables**

There are no traps or enables affecting this operation.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VMALLS12E1IS is a 64-bit system operation.

#### Field descriptions

The TLBI VMALLS12E1IS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBI VMALLS12E1IS operation:

To perform the TLBI VMALLS12E1IS operation:

```
TLBI VMALLS12E1IS
```

The operation is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 01 | 100 | 1000 | 0011 | 110 |

# Chapter C6
# A64 Base Instruction Descriptions

This chapter describes the A64 base instructions.

It contains the following sections:

- *Introduction* on page C6-426.
- *Register size* on page C6-427.
- *Use of the PC* on page C6-428.
- *Use of the stack pointer* on page C6-429.
- *Condition flags and related instructions* on page C6-430.
- *Alphabetical list of instructions* on page C6-431.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## C6.1 Introduction

This chapter provides information on key aspects of the base instructions, and an alphabetic list of instructions from the following functional groups:

- Branch, Exception generation, and system instructions.
- Loads and stores associated with the general-purpose registers.
- Data processing (immediate).
- Data processing (register).

*A64 instruction index by encoding* on page C4-186 provides an overview of the instruction encodings as well as of the instruction classes within their functional groups.

The base instruction descriptions include:

- *Register size* on page C6-427.
- *Use of the PC* on page C6-428.
- *Use of the stack pointer* on page C6-429.
- *Condition flags and related instructions* on page C6-430.

Non-Confidential - Beta

## C6.2 Register size

Most data processing, comparison, and conversion instructions that use the general-purpose registers as the source or destination operand have two instruction variants that operate on either a 32-bit or a 64-bit value.

Where a 32-bit instruction form is selected, the following holds:

- The upper 32 bits of the source registers are ignored.
- The upper 32 bits of the destination register are set to zero.
- Right shifts and right rotates inject at bit[31], not at bit[63].
- The condition flags, where set by the instruction, are computed from the lower 32 bits.

This distinction applies even when the results of a 32-bit instruction form are indistinguishable from the lower 32 bits computed by the equivalent 64-bit instruction form. For example, a 32-bit bitwise `ORR` could be performed using a 64-bit `ORR` and simply ignoring the top 32 bits of the result. However, the A64 instruction set includes separate 32-bit and 64-bit forms of the `ORR` instruction.

As well as distinct sign-extend or zero-extend instructions, the A64 instruction set also provides the ability to extend and shift the final source register of an `ADD`, `SUB`, `ADDS`, `or SUBS` instruction and the index register of a Load/Store instruction. This enables array index calculations involving a 64-bit array pointer and a 32-bit array index to be implemented efficiently.

The assembly language notation enables the distinct identification of registers holding 32-bit values and registers holding 64-bit values. See *Register names* on page C1-122 and *Register indexed addressing* on page C1-126.

*Non-Confidential - Beta*

## C6.3 Use of the PC

A64 instructions have limited access to the PC. The only instructions that can read the PC are those that generate a PC relative address:

- ADR and ADRP.
- The Load register (literal) instruction class.
- Direct branches that use an immediate offset.
- The unconditional branch with link instructions, BL and BLR, that use the PC to create the return link address.

Only explicit control flow instructions can modify the PC:

- Conditional and unconditional branch and return instructions.
- Exception generation and exception return instructions.

For more details on instructions that can modify the PC, see *Branches, Exception generating, and System instructions* on page C3-138.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## C6.4 Use of the stack pointer

A64 instructions can use the stack pointer only in a limited number of cases:

- Load/Store instructions use the current stack pointer as the base address:
  - When stack alignment checking is enabled by system software and the base register is SP, the current stack pointer must be initially quadword aligned, That is, it must be aligned to 16 bytes. Misalignment generates a Stack Alignment fault. See *Stack pointer alignment checking* on page D1-1531 for more information.
- Add and subtract data processing instructions in their immediate and extended register forms, use the current stack pointer as a source register or the destination register or both.
- Logical data processing instructions in their immediate form use the current stack pointer as the destination register.

*Non-Confidential - Beta*

## C6.5 Condition flags and related instructions

The A64 base instructions that use the condition flags as an input are:

- Conditional branch. The conditional branch instruction is `B.cond`.
- Add or subtract with carry. These instruction types include instructions to perform multi-precision arithmetic and calculate checksums. The add or subtract with carry instructions are `ADC`, `ADCS`, `SBC`, and `SBCS`, or an architectural alias for these instructions.
- Conditional select with increment, negate, or invert.This instruction type conditionally selects between one source register and a second, incremented, negated, inverted, or unmodified source register. The conditional select with increment, negate, or invert instructions are `CSINC`, `CSINV`, and `CSNEG`.

  These instructions also implement:

  — Conditional select or move. The condition flags select one of two source registers as the destination register. Short conditional sequences can be replaced by unconditional instructions followed by a conditional select, `CSEL`.

  — Conditional set. Conditionally selects between 0 and 1, or 0 and -1. This can be used to convert the condition flags to a Boolean value or mask in a general-purpose register, for example. These instructions include `CSET` and `CSETM`.
- Conditional compare. This instruction type sets the condition flags to the result of a comparison if the original condition is true, otherwise it sets the condition flags to an immediate value. It permits the flattening of nested conditional expressions without using conditional branches or performing Boolean arithmetic within the general-purpose registers.The conditional compare instructions are `CCMP` and `CCMN`.

The A64 base instructions that update the condition flags as an output are:

- Flag-setting data processing instructions, such as `ADCS`, `ADDS`, `ANDS`, `BICS`, `SBCS`, and `SUBS`, and the aliases `CMN`, `CMP`, and `TST`.
- Conditional compare instructions such as `CCMN`, `CCMP`.

The flags can be directly accessed for a read/write using the *NZCV, Condition Flags* on page C5-306.

The A64 base instructions also include conditional branch instructions that do not use the condition flags as an input:

- Compare and branch if a register is zero or nonzero, `CBZ` and `CBNZ`.
- Test a single bit in a register and branch if the bit is zero or nonzero, `TBZ` and `TBNZ`.

*Non-Confidential - Beta*

## C6.6.1 ADC

Add with Carry adds two register values and the Carry flag value, and writes the result to the destination register.

### *32-bit variant*

Applies when `sf = 0`.

```
ADC <Wd>, <Wn>, <Wm>
```

### *64-bit variant*

Applies when `sf = 1`.

```
ADC <Xd>, <Xn>, <Xm>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
```

### Assembler symbols

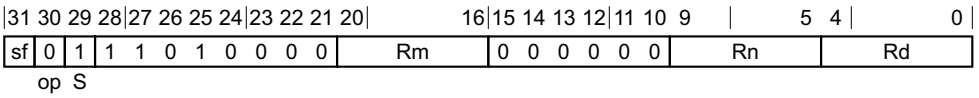
| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Wm> | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |

### Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bits(4) nzcv;

if sub_op then
    operand2 = NOT(operand2);

(result, nzcv) = AddWithCarry(operand1, operand2, PSTATE.C);



if setflags then
    PSTATE.<N,Z,C,V> = nzcv;

X[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.2 ADCS

Add with Carry, setting flags, adds two register values and the Carry flag value, and writes the result to the destination register. It updates the condition flags based on the result.

### 32-bit variant

Applies when `sf = 0`.

```
ADCS <Wd>, <Wn>, <Wm>
```

### 64-bit variant

Applies when `sf = 1`.

```
ADCS <Xd>, <Xn>, <Xm>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
```

## Assembler symbols

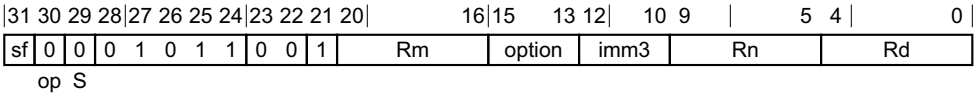
| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |

## Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bits(4) nzcv;

if sub_op then
    operand2 = NOT(operand2);

(result, nzcv) = AddWithCarry(operand1, operand2, PSTATE.C);



if setflags then
    PSTATE.<N,Z,C,V> = nzcv;

X[d] = result;
```

Non-Confidential - Beta

### C6.6.3 ADD (extended register)

Add (extended register) adds a register value and a sign or zero-extended register value, followed by an optional left shift amount, and writes the result to the destination register. The argument that is extended from the <Rm> register can be a byte, halfword, word, or doubleword.

#### *32-bit variant*

Applies when `sf = 0`.

```
ADD <Wd|WSP>, <Wn|WSP>, <Wm>{, <extend> {#<amount>}}
```

#### *64-bit variant*

Applies when `sf = 1`.

```
ADD <Xd|SP>, <Xn|SP>, <R><m>{, <extend> {#<amount>}}
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
ExtendType extend_type = DecodeRegExtend(option);
integer shift = UInt(imm3);
if shift > 4 then ReservedValue();
```

### Assembler symbols

<Wd|WSP> Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

<Wn|WSP> Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

<Xd|SP> Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

<R> Is a width specifier, encoded in the "option" field. It can have the following values:

- `W` when `option = 00x`
- `W` when `option = 010`
- `X` when `option = x11`
- `W` when `option = 10x`
- `W` when `option = 110`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<m> Is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.

<extend> For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

LSL|UXTW when option = 010

UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

SXTX when option = 111

If "Rd" or "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

UXTW when option = 010

LSL|UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

SXTX when option = 111

If "Rd" or "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTX when "option" is '011'.

<amount> Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

## Operation

```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = ExtendReg(m, extend_type, shift);
bits(4) nzcv;
bit carry_in;

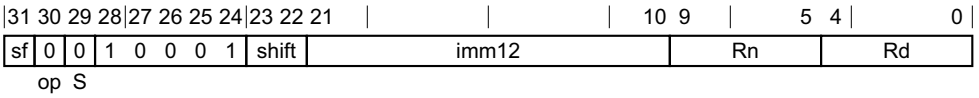
if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';

(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);

if setflags then
    PSTATE.<N,Z,C,V> = nzcv;

if d == 31 && !setflags then
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



```
        SP[] = result;
    else
        X[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.4 ADD (immediate)

Add (immediate) adds a register value and an optionally-shifted immediate value, and writes the result to the destination register.

This instruction is used by the alias MOV (to/from SP). See the *Alias conditions* table for details of when each alias is preferred.

### *32-bit variant*

Applies when `sf = 0`.

```
ADD <Wd|WSP>, <Wn|WSP>, #<imm>{, <shift>}
```

### *64-bit variant*

Applies when `sf = 1`.

```
ADD <Xd|SP>, <Xn|SP>, #<imm>{, <shift>}
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
bits(datasize) imm;

case shift of
    when '00' imm = ZeroExtend(imm12, datasize);
    when '01' imm = ZeroExtend(imm12 : Zeros(12), datasize);
    when '1x' ReservedValue();
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| MOV (to/from SP) | `shift == '00' && imm12 == '000000000000' && (Rd == '11111' \|\| Rn == '11111')` |

## Assembler symbols

`<Wd|WSP>` Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

`<Wn|WSP>` Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

`<Xd|SP>` Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

`<Xn|SP>` Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

`<imm>` Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "shift" field. It can have the following values:

LSL #0 when shift = 00

LSL #12 when shift = 01

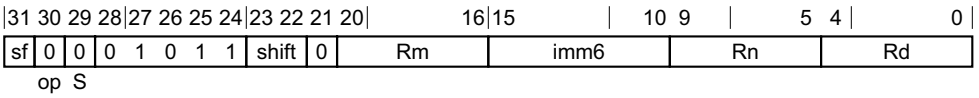
The encoding shift = 1x is reserved.

## Operation

```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = imm;
bits(4) nzcv;
bit carry_in;

if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';

(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);



if setflags then
    PSTATE.<N,Z,C,V> = nzcv;

if d == 31 && !setflags then
    SP[] = result;
else
    X[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.5 ADD (shifted register)

Add (shifted register) adds a register value and an optionally-shifted register value, and writes the result to the destination register.

#### *32-bit variant*

Applies when `sf = 0`.

```
ADD <Wd>, <Wn>, <Wm>{, <shift> #<amount>}
```

#### *64-bit variant*

Applies when `sf = 1`.

```
ADD <Xd>, <Xn>, <Xm>{, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');

if shift == '11' then ReservedValue();
if sf == '0' && imm6<5> == '1' then ReservedValue();

ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
```

### Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- `LSL` when `shift = 00`
- `LSR` when `shift = 01`
- `ASR` when `shift = 10`

The encoding `shift = 11` is reserved.

`<amount>` For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

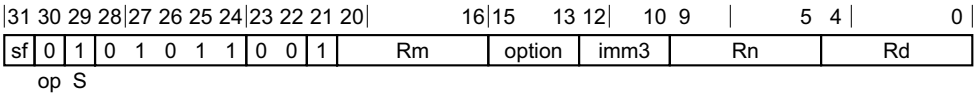
## Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);
bits(4) nzcv;
bit carry_in;

if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';

(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);

if setflags then
    PSTATE.<N,Z,C,V> = nzcv;



X[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.6 ADDS (extended register)

Add (extended register), setting flags, adds a register value and a sign or zero-extended register value, followed by an optional left shift amount, and writes the result to the destination register. The argument that is extended from the <Rm> register can be a byte, halfword, word, or doubleword. It updates the condition flags based on the result.

This instruction is used by the alias CMN (extended register). See the *Alias conditions* table for details of when each alias is preferred.

#### *32-bit variant*

Applies when sf = 0.

```
ADDS <Wd>, <Wn|WSP>, <Wm>{, <extend> {#<amount>}}
```

#### *64-bit variant*

Applies when sf = 1.

```
ADDS <Xd>, <Xn|SP>, <R><m>{, <extend> {#<amount>}}
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
ExtendType extend_type = DecodeRegExtend(option);
integer shift = UInt(imm3);
if shift > 4 then ReservedValue();
```

### Alias conditions

| Alias | is preferred when |
|---|---|
| CMN (extended register) | Rd == '11111' |

### Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn|WSP> Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<R> Is a width specifier, encoded in the "option" field. It can have the following values:

W when option = 00x

W when option = 010

X when option = x11

W when option = 10x

W when option = 110

<m> Is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.

<extend> For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

LSL|UXTW when option = 010

UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

SXTX when option = 111

If "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

UXTW when option = 010

LSL|UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

SXTX when option = 111

If "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTX when "option" is '011'.

<amount> Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

## Operation

```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = ExtendReg(m, extend_type, shift);
bits(4) nzcv;
bit carry_in;

if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);

### C6.6.7 ADDS (immediate)

Add (immediate), setting flags, adds a register value and an optionally-shifted immediate value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias CMN (immediate). See the *Alias conditions* table for details of when each alias is preferred.

#### *32-bit variant*

Applies when `sf = 0`.

```
ADDS <Wd>, <Wn|WSP>, #<imm>{, <shift>}
```

#### *64-bit variant*

Applies when `sf = 1`.

```
ADDS <Xd>, <Xn|SP>, #<imm>{, <shift>}
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
bits(datasize) imm;

case shift of
    when '00' imm = ZeroExtend(imm12, datasize);
    when '01' imm = ZeroExtend(imm12 : Zeros(12), datasize);
    when '1x' ReservedValue();
```

### Alias conditions

| Alias | is preferred when |
|---|---|
| CMN (immediate) | `Rd == '11111'` |

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn\|WSP>` | Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn\|SP>` | Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field. |
| `<imm>` | Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field. |
| `<shift>` | Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "shift" field. It can have the following values:<br>`LSL #0` when `shift = 00` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`LSL #12` when `shift = 01`

The encoding `shift = 1x` is reserved.

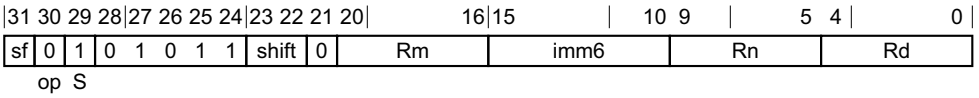
## Operation

```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = imm;
bits(4) nzcv;
bit carry_in;

if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';

(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);

if setflags then
    PSTATE.<N,Z,C,V> = nzcv;



if d == 31 && !setflags then
    SP[] = result;
else
    X[d] = result;
```

### C6.6.8 ADDS (shifted register)

Add (shifted register), setting flags, adds a register value and an optionally-shifted register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias CMN (shifted register). See the *Alias conditions* table for details of when each alias is preferred.

#### *32-bit variant*

Applies when `sf = 0`.

```
ADDS <Wd>, <Wn>, <Wm>{, <shift> #<amount>}
```

#### *64-bit variant*

Applies when `sf = 1`.

```
ADDS <Xd>, <Xn>, <Xm>{, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');

if shift == '11' then ReservedValue();
if sf == '0' && imm6<5> == '1' then ReservedValue();

ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
```

### Alias conditions

| Alias | is preferred when |
|---|---|
| CMN (shifted register) | `Rd == '11111'` |

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<shift> Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

LSL when shift = 00

LSR when shift = 01

ASR when shift = 10

The encoding shift = 11 is reserved.

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

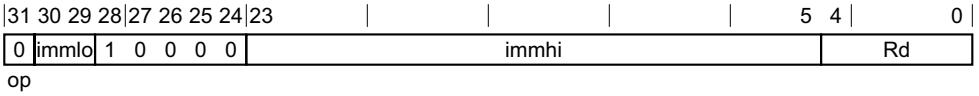
For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

## Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);
bits(4) nzcv;
bit carry_in;

if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';

(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);



if setflags then
    PSTATE.<N,Z,C,V> = nzcv;

X[d] = result;
```

### C6.6.9 ADR

Form PC-relative address adds an immediate value to the PC value to form a PC-relative address, and writes the result to the destination register.

#### *Literal variant*

```
ADR <Xd>, <label>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
boolean page = (op == '1');
bits(64) imm;

if page then
    imm = SignExtend(immhi:immlo:Zeros(12), 64);
else
    imm = SignExtend(immhi:immlo, 64);
```

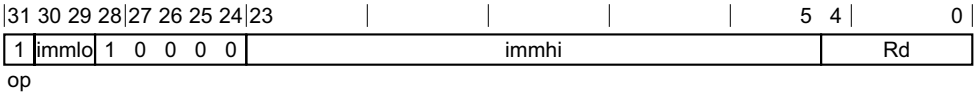
### Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<label> Is the program label whose address is to be calculated. Its offset from the address of this instruction, in the range +/-1MB, is encoded in "immhi:immlo".

### Operation

```
bits(64) base = PC[];



if page then
    base<11:0> = Zeros(12);

X[d] = base + imm;
```

Non-Confidential - Beta

## C6.6.10 ADRP

Form PC-relative address to 4KB page adds an immediate value that is shifted left by 12 bits, to the PC value to form a PC-relative address, with the bottom 12 bits masked out, and writes the result to the destination register.

### *Literal variant*

```
ADRP <Xd>, <label>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
boolean page = (op == '1');
bits(64) imm;

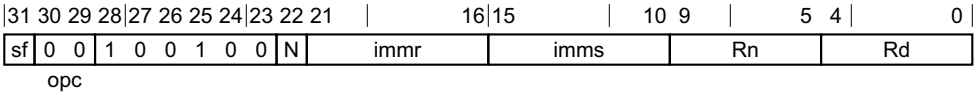
if page then
    imm = SignExtend(immhi:immlo:Zeros(12), 64);
else
    imm = SignExtend(immhi:immlo, 64);
```

### Assembler symbols

| | |
|---|---|
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <label> | Is the program label whose 4KB page address is to be calculated. Its offset from the page address of this instruction, in the range +/-4GB, is encoded as "immhi:immlo" times 4096. |

### Operation

```
bits(64) base = PC[];



if page then
    base<11:0> = Zeros(12);

X[d] = base + imm;
```

### C6.6.11 AND (immediate)

Bitwise AND (immediate) performs a bitwise AND of a register value and an immediate value, and writes the result to the destination register.

#### *32-bit variant*

Applies when `sf = 0 && N = 0`.

```
AND <Wd|WSP>, <Wn>, #<imm>
```

#### *64-bit variant*

Applies when `sf = 1`.

```
AND <Xd|SP>, <Xn>, #<imm>
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
boolean setflags;
LogicalOp op;
case opc of
    when '00' op = LogicalOp_AND; setflags = FALSE;
    when '01' op = LogicalOp_ORR; setflags = FALSE;
    when '10' op = LogicalOp_EOR; setflags = FALSE;
    when '11' op = LogicalOp_AND; setflags = TRUE;

bits(datasize) imm;
if sf == '0' && N != '0' then ReservedValue();
(imm, -) = DecodeBitMasks(N, imms, immr, TRUE);
```

## Assembler symbols

| | |
|---|---|
| <Wd\|WSP> | Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| <Xd\|SP> | Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| <imm> | For the 32-bit variant: is the bitmask immediate, encoded in "imms:immr".<br>For the 64-bit variant: is the bitmask immediate, encoded in "N:imms:immr". |

## Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = imm;

case op of
```

## C6.6.12 AND (shifted register)

Bitwise AND (shifted register) performs a bitwise AND of a register value and an optionally-shifted register value, and writes the result to the destination register.

### 32-bit variant

Applies when `sf = 0`.

```
AND <Wd>, <Wn>, <Wm>{, <shift> #<amount>}
```

### 64-bit variant

Applies when `sf = 1`.

```
AND <Xd>, <Xn>, <Xm>{, <shift> #<amount>}
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean setflags;
LogicalOp op;
case opc of
    when '00' op = LogicalOp_AND; setflags = FALSE;
    when '01' op = LogicalOp_ORR; setflags = FALSE;
    when '10' op = LogicalOp_EOR; setflags = FALSE;
    when '11' op = LogicalOp_AND; setflags = TRUE;

if sf == '0' && imm6<5> == '1' then ReservedValue();

ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
boolean invert = (N == '1');
```

## Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- `LSL` when `shift = 00`
- `LSR` when `shift = 01`
- `ASR` when `shift = 10`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

ROR when shift = 11

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

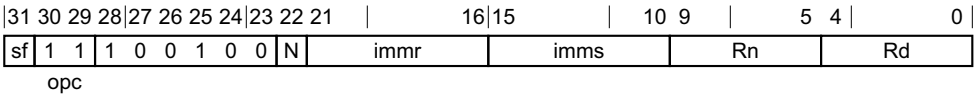
## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);

if invert then operand2 = NOT(operand2);

case op of
    when LogicalOp_AND result = operand1 AND operand2;
    when LogicalOp_ORR result = operand1 OR  operand2;
    when LogicalOp_EOR result = operand1 EOR operand2;

if setflags then
    PSTATE.<N,Z,C,V> = result<datasize-1>:IsZeroBit(result):'00';



X[d] = result;
```

### C6.6.13 ANDS (immediate)

Bitwise AND (immediate), setting flags, performs a bitwise AND of a register value and an immediate value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias TST (immediate). See the *Alias conditions* table for details of when each alias is preferred.

#### *32-bit variant*

Applies when `sf = 0 && N = 0`.

```
ANDS <Wd>, <Wn>, #<imm>
```

#### *64-bit variant*

Applies when `sf = 1`.

```
ANDS <Xd>, <Xn>, #<imm>
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
boolean setflags;
LogicalOp op;
case opc of
    when '00' op = LogicalOp_AND; setflags = FALSE;
    when '01' op = LogicalOp_ORR; setflags = FALSE;
    when '10' op = LogicalOp_EOR; setflags = FALSE;
    when '11' op = LogicalOp_AND; setflags = TRUE;

bits(datasize) imm;
if sf == '0' && N != '0' then ReservedValue();
(imm, -) = DecodeBitMasks(N, imms, immr, TRUE);
```

### Alias conditions

| Alias | is preferred when |
|---|---|
| TST (immediate) | `Rd == '11111'` |

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |

### C6.6.14 ANDS (shifted register)

Bitwise AND (shifted register), setting flags, performs a bitwise AND of a register value and an optionally-shifted register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias TST (shifted register). See the *Alias conditions* table for details of when each alias is preferred.

#### *32-bit variant*

Applies when `sf = 0`.

```
ANDS <Wd>, <Wn>, <Wm>{, <shift> #<amount>}
```

#### *64-bit variant*

Applies when `sf = 1`.

```
ANDS <Xd>, <Xn>, <Xm>{, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean setflags;
LogicalOp op;
case opc of
    when '00' op = LogicalOp_AND; setflags = FALSE;
    when '01' op = LogicalOp_ORR; setflags = FALSE;
    when '10' op = LogicalOp_EOR; setflags = FALSE;
    when '11' op = LogicalOp_AND; setflags = TRUE;

if sf == '0' && imm6<5> == '1' then ReservedValue();

ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
boolean invert = (N == '1');
```

### Alias conditions

| Alias | is preferred when |
|---|---|
| TST (shifted register) | `Rd == '11111'` |

### Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

### C6.6.15 ASR (register)

Arithmetic Shift Right (register) shifts a register value right by a variable number of bits, shifting in copies of its sign bit, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is an alias of the ASRV instruction. This means that:

- The encodings in this description are named to match the encodings of ASRV.
- The description of ASRV gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0`.

`ASR <Wd>, <Wn>, <Wm>`

is equivalent to

`ASRV <Wd>, <Wn>, <Wm>`

and is always the preferred disassembly.

#### *64-bit variant*

Applies when `sf = 1`.

`ASR <Xd>, <Xn>, <Xm>`

is equivalent to

`ASRV <Xd>, <Xn>, <Xm>`

and is always the preferred disassembly.

## Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.

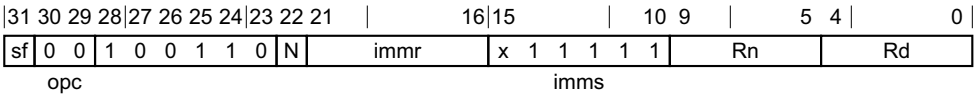
`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

## Operation

The description of ASRV gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.16 ASR (immediate)

Arithmetic Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in copies of the sign bit in the upper bits and zeros in the lower bits, and writes the result to the destination register.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0 && N = 0 && imms = 011111`.

`ASR <Wd>, <Wn>, #<shift>`

is equivalent to

`SBFM <Wd>, <Wn>, #<shift>, #31`

and is always the preferred disassembly.

#### *64-bit variant*

Applies when `sf = 1 && N = 1 && imms = 111111`.

`ASR <Xd>, <Xn>, #<shift>`

is equivalent to

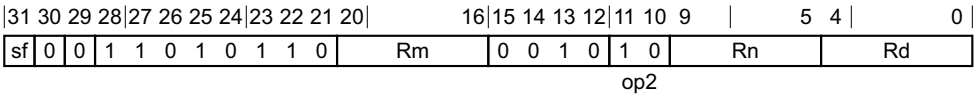
`SBFM <Xd>, <Xn>, #<shift>, #63`

and is always the preferred disassembly.

#### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<shift>` | For the 32-bit variant: is the shift amount, in the range 0 to 31, encoded in the "immr" field.<br>For the 64-bit variant: is the shift amount, in the range 0 to 63, encoded in the "immr" field. |

#### Operation



The description of SBFM gives the operational pseudocode for this instruction.

### C6.6.17 ASRV

Arithmetic Shift Right Variable shifts a register value right by a variable number of bits, shifting in copies of its sign bit, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is used by the alias ASR (register). The alias is always the preferred disassembly.

#### *32-bit variant*

Applies when `sf = 0`.

```
ASRV <Wd>, <Wn>, <Wm>
```

#### *64-bit variant*

Applies when `sf = 1`.

```
ASRV <Xd>, <Xn>, <Xm>
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
ShiftType shift_type = DecodeShift(op2);
```

### Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Wm> | Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field. |

### Operation

```
bits(datasize) result;
bits(datasize) operand2 = X[m];

result = ShiftReg(n, shift_type, UInt(operand2) MOD datasize);
X[d] = result;
```

## C6.6.18 AT

Address Translate. For more information, see A64 system instructions for address translation.

This instruction is an alias of the SYS instruction. This means that:

- The encodings in this description are named to match the encodings of SYS.
- The description of SYS gives the operational pseudocode for this instruction.

### *System variant*

`AT <at_op>, <Xt>`

is equivalent to

`SYS #<op1>, C7, C8, #<op2>, <Xt>`

and is the preferred disassembly when `SysOp(op1,'0111','1000',op2) == Sys_AT`.

### Assembler symbols

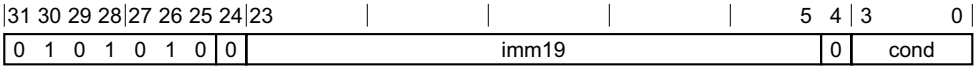
`<at_op>` Is an AT operation name, as listed for the AT system operation group, encoded in the "op1:op2" field. It can have the following values:

| | |
|---|---|
| `S1E1R` | when `op1 = 000`, `op2 = 000` |
| `S1E1W` | when `op1 = 000`, `op2 = 001` |
| `S1E0R` | when `op1 = 000`, `op2 = 010` |
| `S1E0W` | when `op1 = 000`, `op2 = 011` |
| `S1E2R` | when `op1 = 100`, `op2 = 000` |
| `S1E2W` | when `op1 = 100`, `op2 = 001` |
| `S12E1R` | when `op1 = 100`, `op2 = 100` |
| `S12E1W` | when `op1 = 100`, `op2 = 101` |
| `S12E0R` | when `op1 = 100`, `op2 = 110` |
| `S12E0W` | when `op1 = 100`, `op2 = 111` |
| `S1E3R` | when `op1 = 110`, `op2 = 000` |
| `S1E3W` | when `op1 = 110`, `op2 = 001` |

`<op1>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.

`<op2>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

`<Xt>` Is the 64-bit name of the general-purpose source register, encoded in the "Rt" field.



### Operation

The description of SYS gives the operational pseudocode for this instruction.

## C6.6.19 B.cond

Branch conditionally to a label at a PC-relative offset, with a hint that this is not a subroutine call or return.

### *19-bit signed PC-relative branch offset variant*

```
B.<cond> <label>
```

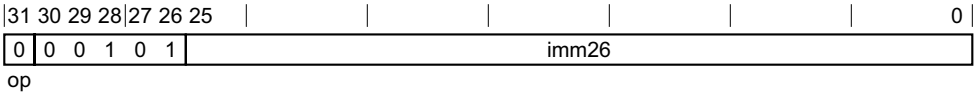
### *Decode for this encoding*

```
bits(64) offset = SignExtend(imm19:'00', 64);
bits(4) condition = cond;
```

### Assembler symbols

<cond> Is one of the standard conditions, encoded in the "cond" field in the standard way.

<label> Is the program label to be conditionally branched to. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4.



### Operation

```
if ConditionHolds(condition) then
    BranchTo(PC[] + offset, BranchType_JMP);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.20 B

Branch causes an unconditional branch to a label at a PC-relative offset, with a hint that this is not a subroutine call or return.

### 26-bit signed PC-relative branch offset variant

```
B <label>
```

### Decode for this encoding

```
BranchType branch_type = if op == '1' then BranchType_CALL else BranchType_JMP;
bits(64) offset = SignExtend(imm26:'00', 64);
```

## Assembler symbols

<label> Is the program label to be unconditionally branched to. Its offset from the address of this instruction, in the range +/-128MB, is encoded as "imm26" times 4.

## Operation

```
if branch_type == BranchType_CALL then X[30] = PC[] + 4;

BranchTo(PC[] + offset, branch_type);
```

## C6.6.21 BFI

Bitfield Insert copies any number of low-order bits from a source register into the same number of adjacent bits at any position in the destination register, leaving other bits unchanged.

This instruction is an alias of the BFM instruction. This means that:

- The encodings in this description are named to match the encodings of BFM.
- The description of BFM gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0 && N = 0`.

```
BFI <Wd>, <Wn>, #<lsb>, #<width>
```

is equivalent to

```
BFM  <Wd>, <Wn>, #(-<lsb> MOD 32), #(<width>-1)
```

and is the preferred disassembly when `UInt(imms) < UInt(immr)`.

### *64-bit variant*

Applies when `sf = 1 && N = 1`.

```
BFI <Xd>, <Xn>, #<lsb>, #<width>
```

is equivalent to

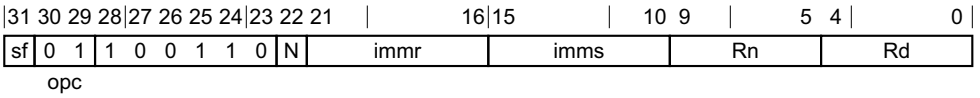
```
BFM  <Xd>, <Xn>, #(-<lsb> MOD 64), #(<width>-1)
```

and is the preferred disassembly when `UInt(imms) < UInt(immr)`.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<lsb>` | For the 32-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 31.<br>For the 64-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 63. |
| `<width>` | For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<lsb>.<br>For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<lsb>. |

### Operation



The description of BFM gives the operational pseudocode for this instruction.

## C6.6.22 BFM

Bitfield Move copies any number of low-order bits from a source register into the same number of adjacent bits at any position in the destination register, leaving other bits unchanged.

This instruction is used by the aliases BFI and BFXIL. See the *Alias conditions* on page C6-466 table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0 && N = 0`.

```
BFM <Wd>, <Wn>, #<immr>, #<imms>
```

### 64-bit variant

Applies when `sf = 1 && N = 1`.

```
BFM <Xd>, <Xn>, #<immr>, #<imms>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;

boolean inzero;
boolean extend;
integer R;
integer S;
bits(datasize) wmask;
bits(datasize) tmask;

case opc of
    when '00' inzero = TRUE;  extend = TRUE;    // SBFM
    when '01' inzero = FALSE; extend = FALSE;   // BFM
    when '10' inzero = TRUE;  extend = FALSE;   // UBFM
    when '11' UnallocatedEncoding();

if sf == '1' && N != '1' then ReservedValue();
if sf == '0' && (N != '0' || immr<5> != '0' || imms<5> != '0') then ReservedValue();

R = UInt(immr);
S = UInt(imms);
(wmask, tmask) = DecodeBitMasks(N, imms, immr, FALSE);
```

Non-Confidential - Beta

### Alias conditions

| Alias | is preferred when |
|---|---|
| BFI | `UInt(imms) < UInt(immr)` |
| BFXIL | `UInt(imms) >= UInt(immr)` |

### Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

`<immr>` For the 32-bit variant: is the right rotate amount, in the range 0 to 31, encoded in the "immr" field.

For the 64-bit variant: is the right rotate amount, in the range 0 to 63, encoded in the "immr" field.

`<imms>` For the 32-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 31, encoded in the "imms" field.

For the 64-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 63, encoded in the "imms" field.

### Operation

```
bits(datasize) dst = if inzero then Zeros() else X[d];
bits(datasize) src = X[n];

// perform bitfield move on low bits
bits(datasize) bot = (dst AND NOT(wmask)) OR (ROR(src, R) AND wmask);

// determine extension bits (sign, zero or dest register)
bits(datasize) top = if extend then Replicate(src<S>) else dst;

// combine extension bits and result bits
X[d] = (top AND NOT(tmask)) OR (bot AND tmask);
```

## C6.6.23 BFXIL

Bitfield extract and insert at low end copies any number of low-order bits from a source register into the same number of adjacent bits at the low end in the destination register, leaving other bits unchanged.

This instruction is an alias of the BFM instruction. This means that:

- The encodings in this description are named to match the encodings of BFM.
- The description of BFM gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0 && N = 0`.

```
BFXIL <Wd>, <Wn>, #<lsb>, #<width>
```

is equivalent to

```
BFM  <Wd>, <Wn>, #<lsb>, #(<lsb>+<width>-1)
```

and is the preferred disassembly when `UInt(imms) >= UInt(immr)`.

### *64-bit variant*

Applies when `sf = 1 && N = 1`.

```
BFXIL <Xd>, <Xn>, #<lsb>, #<width>
```

is equivalent to

```
BFM  <Xd>, <Xn>, #<lsb>, #(<lsb>+<width>-1)
```

and is the preferred disassembly when `UInt(imms) >= UInt(immr)`.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<lsb>` | For the 32-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 31.<br>For the 64-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 63. |
| `<width>` | For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<lsb>.<br>For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<lsb>. |

### C6.6.24 BIC (shifted register)

Bitwise Bit Clear (shifted register) performs a bitwise AND of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register.

#### *32-bit variant*

Applies when `sf = 0`.

```
BIC <Wd>, <Wn>, <Wm>{, <shift> #<amount>}
```

#### *64-bit variant*

Applies when `sf = 1`.

```
BIC <Xd>, <Xn>, <Xm>{, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean setflags;
LogicalOp op;
case opc of
    when '00' op = LogicalOp_AND; setflags = FALSE;
    when '01' op = LogicalOp_ORR; setflags = FALSE;
    when '10' op = LogicalOp_EOR; setflags = FALSE;
    when '11' op = LogicalOp_AND; setflags = TRUE;

if sf == '0' && imm6<5> == '1' then ReservedValue();

ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
boolean invert = (N == '1');
```

### Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- `LSL` when `shift = 00`
- `LSR` when `shift = 01`
- `ASR` when `shift = 10`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

ROR when shift = 11

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

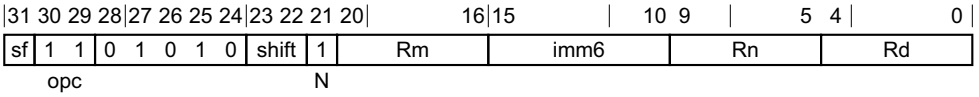
For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);

if invert then operand2 = NOT(operand2);

case op of
    when LogicalOp_AND result = operand1 AND operand2;
    when LogicalOp_ORR result = operand1 OR  operand2;
    when LogicalOp_EOR result = operand1 EOR operand2;



if setflags then
    PSTATE.<N,Z,C,V> = result<datasize-1>:IsZeroBit(result):'00';

X[d] = result;
```

## C6.6.25 BICS (shifted register)

Bitwise Bit Clear (shifted register), setting flags, performs a bitwise AND of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register. It updates the condition flags based on the result.

### 32-bit variant

Applies when `sf = 0`.

```
BICS <Wd>, <Wn>, <Wm>{, <shift> #<amount>}
```

### 64-bit variant

Applies when `sf = 1`.

```
BICS <Xd>, <Xn>, <Xm>{, <shift> #<amount>}
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean setflags;
LogicalOp op;
case opc of
    when '00' op = LogicalOp_AND; setflags = FALSE;
    when '01' op = LogicalOp_ORR; setflags = FALSE;
    when '10' op = LogicalOp_EOR; setflags = FALSE;
    when '11' op = LogicalOp_AND; setflags = TRUE;

if sf == '0' && imm6<5> == '1' then ReservedValue();

ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
boolean invert = (N == '1');
```

## Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- `LSL` when `shift = 00`
- `LSR` when `shift = 01`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

ASR when shift = 10

ROR when shift = 11

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

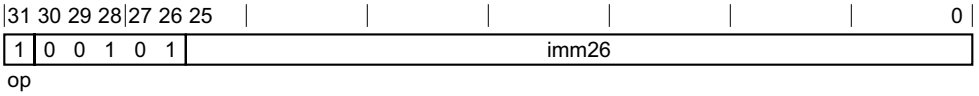
For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);

if invert then operand2 = NOT(operand2);

case op of
    when LogicalOp_AND result = operand1 AND operand2;
    when LogicalOp_ORR result = operand1 OR  operand2;
    when LogicalOp_EOR result = operand1 EOR operand2;



if setflags then
    PSTATE.<N,Z,C,V> = result<datasize-1>:IsZeroBit(result):'00';

X[d] = result;
```

## C6.6.26 BL

Branch with Link branches to a PC-relative offset, setting the register X30 to PC+4. It provides a hint that this is a subroutine call.

### *26-bit signed PC-relative branch offset variant*

```
BL <label>
```

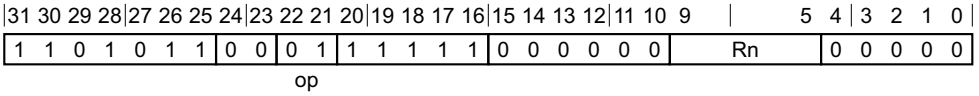
### *Decode for this encoding*

```
BranchType branch_type = if op == '1' then BranchType_CALL else BranchType_JMP;
bits(64) offset = SignExtend(imm26:'00', 64);
```

### Assembler symbols

| | |
|---|---|
| <label> | Is the program label to be unconditionally branched to. Its offset from the address of this instruction, in the range +/-128MB, is encoded as "imm26" times 4. |

### Operation



```
if branch_type == BranchType_CALL then X[30] = PC[] + 4;

BranchTo(PC[] + offset, branch_type);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.27 BLR

Branch with Link to Register calls a subroutine at an address in a register, setting register X30 to PC+4.

### *Integer variant*

```
BLR <Xn>
```

### *Decode for this encoding*

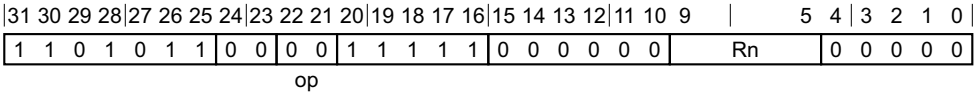
```
integer n = UInt(Rn);
BranchType branch_type;

case op of
    when '00' branch_type = BranchType_JMP;
    when '01' branch_type = BranchType_CALL;
    when '10' branch_type = BranchType_RET;
    otherwise UnallocatedEncoding();
```

## Assembler symbols

<Xn> Is the 64-bit name of the general-purpose register holding the address to be branched to, encoded in the "Rn" field.

## Operation



```
bits(64) target = X[n];

if branch_type == BranchType_CALL then X[30] = PC[] + 4;
BranchTo(target, branch_type);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.28 BR

Branch to Register branches unconditionally to an address in a register, with a hint that this is not a subroutine return.

### *Integer variant*

```
BR <Xn>
```

### *Decode for this encoding*

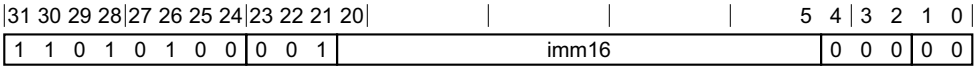
```
integer n = UInt(Rn);
BranchType branch_type;

case op of
    when '00' branch_type = BranchType_JMP;
    when '01' branch_type = BranchType_CALL;
    when '10' branch_type = BranchType_RET;
    otherwise UnallocatedEncoding();
```

### Assembler symbols

<Xn> Is the 64-bit name of the general-purpose register holding the address to be branched to, encoded in the "Rn" field.

### Operation



```
bits(64) target = X[n];

if branch_type == BranchType_CALL then X[30] = PC[] + 4;
BranchTo(target, branch_type);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.29 BRK

Breakpoint instruction causes a Software Breakpoint Instruction exception. The PE records the exception in ESR_ELx, using the EC value 0x3c, and captures the value of the immediate argument in ESR_ELx.ISS.

### *System variant*

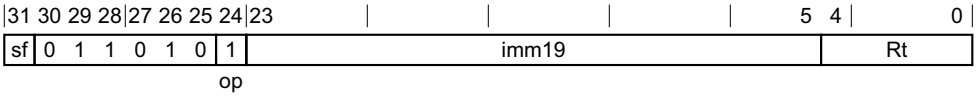
```
BRK #<imm>
```

### *Decode for this encoding*

```
bits(16) comment = imm16;
```

### Assembler symbols

<imm> Is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.



### Operation

```
AArch64.SoftwareBreakpoint(comment);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.30 CBNZ

Compare and Branch on Nonzero compares the value in a register with zero, and conditionally branches to a label at a PC-relative offset if the comparison is not equal. It provides a hint that this is not a subroutine call or return. This instruction does not affect the condition flags.

### *32-bit variant*

Applies when `sf = 0`.

```
CBNZ <Wt>, <label>
```

### *64-bit variant*

Applies when `sf = 1`.

```
CBNZ <Xt>, <label>
```

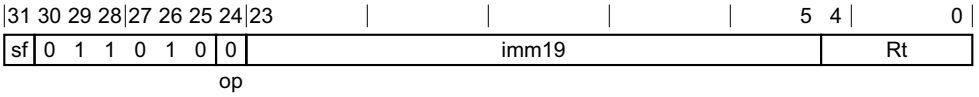
### *Decode for all variants of this encoding*

```
integer t = UInt(Rt);
integer datasize = if sf == '1' then 64 else 32;
boolean iszero = (op == '0');
bits(64) offset = SignExtend(imm19:'00', 64);
```

## Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be tested, encoded in the "Rt" field. |
| `<Xt>` | Is the 64-bit name of the general-purpose register to be tested, encoded in the "Rt" field. |
| `<label>` | Is the program label to be conditionally branched to. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4. |

## Operation



```
bits(datasize) operand1 = X[t];

if IsZero(operand1) == iszero then
    BranchTo(PC[] + offset, BranchType_JMP);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.31 CBZ

Compare and Branch on Zero compares the value in a register with zero, and conditionally branches to a label at a PC-relative offset if the comparison is equal. It provides a hint that this is not a subroutine call or return. This instruction does not affect condition flags.

### 32-bit variant

Applies when `sf = 0`.

```
CBZ <Wt>, <label>
```

### 64-bit variant

Applies when `sf = 1`.

```
CBZ <Xt>, <label>
```

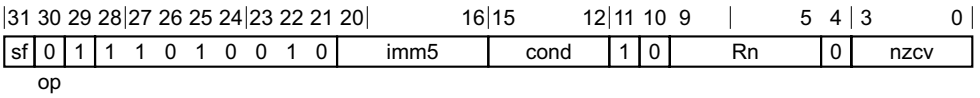
### Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer datasize = if sf == '1' then 64 else 32;
boolean iszero = (op == '0');
bits(64) offset = SignExtend(imm19:'00', 64);
```

## Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be tested, encoded in the "Rt" field. |
| `<Xt>` | Is the 64-bit name of the general-purpose register to be tested, encoded in the "Rt" field. |
| `<label>` | Is the program label to be conditionally branched to. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4. |

## Operation



```
bits(datasize) operand1 = X[t];

if IsZero(operand1) == iszero then
    BranchTo(PC[] + offset, BranchType_JMP);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.32 CCMN (immediate)

Conditional Compare Negative (immediate) sets the value of the condition flags to the result of the comparison of a register value and a negated immediate value if the condition is TRUE, and an immediate value otherwise.

### *32-bit variant*

Applies when `sf = 0`.

```
CCMN <Wn>, #<imm>, #<nzcv>, <cond>
```

### *64-bit variant*

Applies when `sf = 1`.

```
CCMN <Xn>, #<imm>, #<nzcv>, <cond>
```

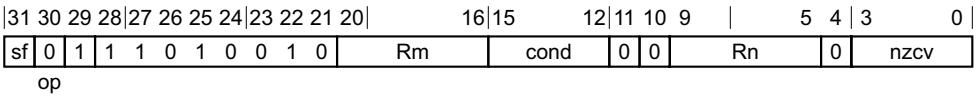
### *Decode for all variants of this encoding*

```
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
bits(4) condition = cond;
bits(4) flags = nzcv;
bits(datasize) imm = ZeroExtend(imm5, datasize);
```

## Assembler symbols

| | |
|---|---|
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <imm> | Is a five bit unsigned (positive) immediate encoded in the "imm5" field. |
| <nzcv> | Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field. |
| <cond> | Is one of the standard conditions, encoded in the "cond" field in the standard way. |

## Operation



```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = imm;
bit carry_in = '0';

if ConditionHolds(condition) then
    if sub_op then
        operand2 = NOT(operand2);
        carry_in = '1';
    (-, flags) = AddWithCarry(operand1, operand2, carry_in);
PSTATE.<N,Z,C,V> = flags;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.33 CCMN (register)

Conditional Compare Negative (register) sets the value of the condition flags to the result of the comparison of a register value and the inverse of another register value if the condition is TRUE, and an immediate value otherwise.

### *32-bit variant*

Applies when `sf = 0`.

```
CCMN <Wn>, <Wm>, #<nzcv>, <cond>
```

### *64-bit variant*

Applies when `sf = 1`.

```
CCMN <Xn>, <Xm>, #<nzcv>, <cond>
```

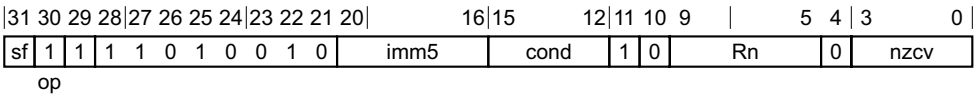
### *Decode for all variants of this encoding*

```
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
bits(4) condition = cond;
bits(4) flags = nzcv;
```

## Assembler symbols

| | |
|---|---|
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Wm> | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| <nzcv> | Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field. |
| <cond> | Is one of the standard conditions, encoded in the "cond" field in the standard way. |

## Operation



```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bit carry_in = '0';

if ConditionHolds(condition) then
    if sub_op then
        operand2 = NOT(operand2);
        carry_in = '1';
    (-, flags) = AddWithCarry(operand1, operand2, carry_in);
PSTATE.<N,Z,C,V> = flags;
```

### C6.6.34 CCMP (immediate)

Conditional Compare (immediate) sets the value of the condition flags to the result of the comparison of a register value and an immediate value if the condition is TRUE, and an immediate value otherwise.

#### *32-bit variant*

Applies when `sf = 0`.

```
CCMP <Wn>, #<imm>, #<nzcv>, <cond>
```

#### *64-bit variant*

Applies when `sf = 1`.

```
CCMP <Xn>, #<imm>, #<nzcv>, <cond>
```

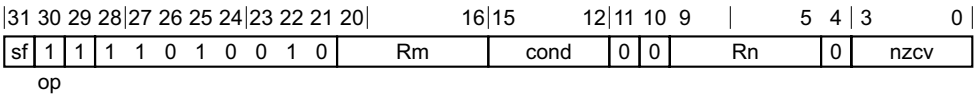
#### *Decode for all variants of this encoding*

```
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
bits(4) condition = cond;
bits(4) flags = nzcv;
bits(datasize) imm = ZeroExtend(imm5, datasize);
```

### Assembler symbols

| | |
|---|---|
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <imm> | Is a five bit unsigned (positive) immediate encoded in the "imm5" field. |
| <nzcv> | Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field. |
| <cond> | Is one of the standard conditions, encoded in the "cond" field in the standard way. |

### Operation



```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = imm;
bit carry_in = '0';

if ConditionHolds(condition) then
    if sub_op then
        operand2 = NOT(operand2);
        carry_in = '1';
    (-, flags) = AddWithCarry(operand1, operand2, carry_in);
PSTATE.<N,Z,C,V> = flags;
```

## C6.6.35 CCMP (register)

Conditional Compare (register) sets the value of the condition flags to the result of the comparison of two registers if the condition is TRUE, and an immediate value otherwise.

### *32-bit variant*

Applies when `sf = 0`.

```
CCMP <Wn>, <Wm>, #<nzcv>, <cond>
```

### *64-bit variant*

Applies when `sf = 1`.

```
CCMP <Xn>, <Xm>, #<nzcv>, <cond>
```

### *Decode for all variants of this encoding*

```
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
bits(4) condition = cond;
bits(4) flags = nzcv;
```

## Assembler symbols

| | |
|---|---|
| `<Wn>` | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<nzcv>` | Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field. |
| `<cond>` | Is one of the standard conditions, encoded in the "cond" field in the standard way. |

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bit carry_in = '0';

if ConditionHolds(condition) then
    if sub_op then
        operand2 = NOT(operand2);
        carry_in = '1';
    (-, flags) = AddWithCarry(operand1, operand2, carry_in);
PSTATE.<N,Z,C,V> = flags;
```

### C6.6.36 CINC

Conditional Increment returns, in the destination register, the value of the source register incremented by 1 if the condition is TRUE, and otherwise returns the value of the source register.

This instruction is an alias of the CSINC instruction. This means that:

- The encodings in this description are named to match the encodings of CSINC.
- The description of CSINC gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0`.

`CINC <Wd>, <Wn>, <cond>`

is equivalent to

`CSINC <Wd>, <Wn>, <Wn>, invert(<cond>)`

and is the preferred disassembly when `Rn == Rm`.

#### *64-bit variant*

Applies when `sf = 1`.

`CINC <Xd>, <Xn>, <cond>`

is equivalent to

`CSINC <Xd>, <Xn>, <Xn>, invert(<cond>)`

and is the preferred disassembly when `Rn == Rm`.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields. |
| `<cond>` | Is one of the standard conditions, excluding AL and NV, encoded in the "cond" field with its least significant bit inverted. |

### Operation

The description of CSINC gives the operational pseudocode for this instruction.

Non-Confidential - Beta

## C6.6.37 CINV

Conditional Invert returns, in the destination register, the bitwise inversion of the value of the source register if the condition is TRUE, and otherwise returns the value of the source register.

This instruction is an alias of the CSINV instruction. This means that:

- The encodings in this description are named to match the encodings of CSINV.
- The description of CSINV gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

`CINV <Wd>, <Wn>, <cond>`

is equivalent to

`CSINV <Wd>, <Wn>, <Wn>, invert(<cond>)`

and is the preferred disassembly when `Rn == Rm`.

### *64-bit variant*

Applies when `sf = 1`.

`CINV <Xd>, <Xn>, <cond>`

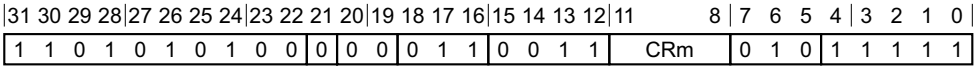
is equivalent to

`CSINV <Xd>, <Xn>, <Xn>, invert(<cond>)`

and is the preferred disassembly when `Rn == Rm`.

## Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields. |
| `<cond>` | Is one of the standard conditions, excluding AL and NV, encoded in the "cond" field with its least significant bit inverted. |



## Operation

The description of CSINV gives the operational pseudocode for this instruction.

### C6.6.38 CLREX

Clear Exclusive clears the local monitor of the executing PE.

#### *System variant*

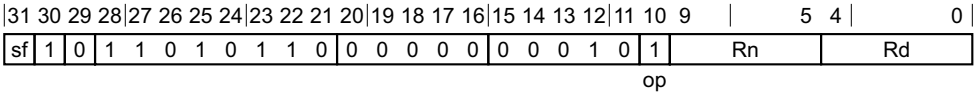
```
CLREX {#<imm>}
```

#### *Decode for this encoding*

```
// CRm field is ignored
```

#### Assembler symbols

<imm> Is an optional 4-bit unsigned immediate, in the range 0 to 15, defaulting to 15 and encoded in the "CRm" field.



#### Operation

```
ClearExclusiveLocal(ProcessorID());
```

Non-Confidential - Beta

## C6.6.39 CLS

Count leading sign bits : `Rd = CLS(Rn)`

### *32-bit variant*

Applies when `sf = 0`.

```
CLS <Wd>, <Wn>
```

### *64-bit variant*

Applies when `sf = 1`.

```
CLS <Xd>, <Xn>
```

### *Decode for all variants of this encoding*

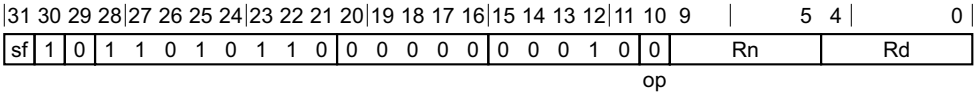
```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
CountOp opcode = if op == '0' then CountOp_CLZ else CountOp_CLS;
```

## Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |

## Operation

```
integer result;
bits(datasize) operand1 = X[n];



if opcode == CountOp_CLZ then
    result = CountLeadingZeroBits(operand1);
else
    result = CountLeadingSignBits(operand1);

X[d] = result<datasize-1:0>;
```

Non-Confidential - Beta

## C6.6.40 CLZ

Count leading zero bits : `Rd = CLZ(Rn)`

### *32-bit variant*

Applies when `sf = 0`.

```
CLZ <Wd>, <Wn>
```

### *64-bit variant*

Applies when `sf = 1`.

```
CLZ <Xd>, <Xn>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
CountOp opcode = if op == '0' then CountOp_CLZ else CountOp_CLS;
```

## Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |

## Operation

```
integer result;
bits(datasize) operand1 = X[n];

if opcode == CountOp_CLZ then
    result = CountLeadingZeroBits(operand1);
else
    result = CountLeadingSignBits(operand1);

X[d] = result<datasize-1:0>;
```

## C6.6.41 CMN (extended register)

Compare Negative (extended register) adds a register value and a sign or zero-extended register value, followed by an optional left shift amount. The argument that is extended from the <Rm> register can be a byte, halfword, word, or doubleword. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the ADDS (extended register) instruction. This means that:

- The encodings in this description are named to match the encodings of ADDS (extended register).
- The description of ADDS (extended register) gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

```
CMN <Wn|WSP>, <Wm>{, <extend> {#<amount>}}
```

is equivalent to

```
ADDS WZR, <Wn|WSP>, <Wm>{, <extend> {#<amount>}}
```

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

```
CMN <Xn|SP>, <R><m>{, <extend> {#<amount>}}
```

is equivalent to

```
ADDS XZR, <Xn|SP>, <R><m>{, <extend> {#<amount>}}
```

and is always the preferred disassembly.

### Assembler symbols

<Wn|WSP> Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

<Xn|SP> Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

<R> Is a width specifier, encoded in the "option" field. It can have the following values:

| | |
|---|---|
| W | when `option = 00x` |
| W | when `option = 010` |
| X | when `option = x11` |
| W | when `option = 10x` |
| W | when `option = 110` |

<m> Is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<extend> For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

LSL|UXTW when option = 010

UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

SXTX when option = 111

If "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

UXTW when option = 010

LSL|UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

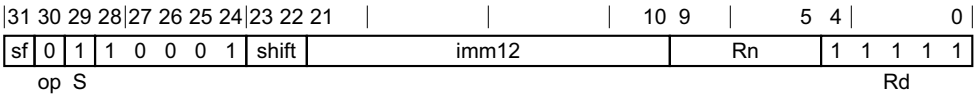
SXTX when option = 111

If "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTX when "option" is '011'.

<amount> Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

## Operation

The description of ADDS (extended register) gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.42 CMN (immediate)

Compare Negative (immediate) adds a register value and an optionally-shifted immediate value. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the ADDS (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of ADDS (immediate).
- The description of ADDS (immediate) gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

`CMN <Wn|WSP>, #<imm>{, <shift>}`

is equivalent to

`ADDS WZR, <Wn|WSP>, #<imm> {, <shift>}`

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

`CMN <Xn|SP>, #<imm>{, <shift>}`

is equivalent to

`ADDS XZR, <Xn|SP>, #<imm> {, <shift>}`

and is always the preferred disassembly.

### Assembler symbols

`<Wn|WSP>` Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

`<Xn|SP>` Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

`<imm>` Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.

`<shift>` Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "shift" field. It can have the following values:

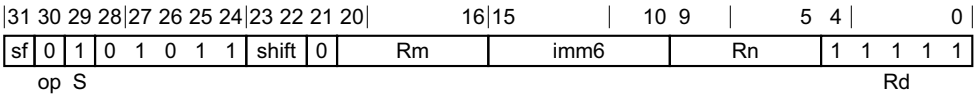
`LSL #0` when `shift = 00`

`LSL #12` when `shift = 01`

The encoding `shift = 1x` is reserved.

### Operation

The description of ADDS (immediate) gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.43 CMN (shifted register)

Compare Negative (shifted register) adds a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the ADDS (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of ADDS (shifted register).
- The description of ADDS (shifted register) gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0`.

```
CMN <Wn>, <Wm>{, <shift> #<amount>}
```

is equivalent to

```
ADDS WZR, <Wn>, <Wm> {, <shift> #<amount>}
```

and is always the preferred disassembly.

#### *64-bit variant*

Applies when `sf = 1`.

```
CMN <Xn>, <Xm>{, <shift> #<amount>}
```

is equivalent to

```
ADDS XZR, <Xn>, <Xm> {, <shift> #<amount>}
```

and is always the preferred disassembly.

### Assembler symbols

`<Wn>` Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

`LSL` when `shift = 00`

`LSR` when `shift = 01`

`ASR` when `shift = 10`

The encoding `shift = 11` is reserved.

`<amount>` For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

## C6.6.44 CMP (extended register)

Compare (extended register) subtracts a sign or zero-extended register value, followed by an optional left shift amount, from a register value. The argument that is extended from the <Rm> register can be a byte, halfword, word, or doubleword. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the SUBS (extended register) instruction. This means that:

- The encodings in this description are named to match the encodings of SUBS (extended register).
- The description of SUBS (extended register) gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

```
CMP <Wn|WSP>, <Wm>{, <extend> {#<amount>}}
```

is equivalent to

```
SUBS WZR, <Wn|WSP>, <Wm>{, <extend> {#<amount>}}
```

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

```
CMP <Xn|SP>, <R><m>{, <extend> {#<amount>}}
```

is equivalent to

```
SUBS XZR, <Xn|SP>, <R><m>{, <extend> {#<amount>}}
```

and is always the preferred disassembly.

### Assembler symbols

<Wn|WSP> Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

<Xn|SP> Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

<R> Is a width specifier, encoded in the "option" field. It can have the following values:

| | |
|---|---|
| W | when `option = 00x` |
| W | when `option = 010` |
| X | when `option = x11` |
| W | when `option = 10x` |
| W | when `option = 110` |

<m> Is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<extend> For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

LSL|UXTW when option = 010

UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

SXTX when option = 111

If "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

UXTW when option = 010

LSL|UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

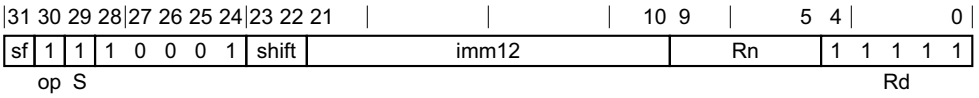
SXTX when option = 111

If "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTX when "option" is '011'.

<amount> Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

## Operation

The description of SUBS (extended register) gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.45 CMP (immediate)

Compare (immediate) subtracts an optionally-shifted immediate value from a register value. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the SUBS (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of SUBS (immediate).
- The description of SUBS (immediate) gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

```
CMP <Wn|WSP>, #<imm>{, <shift>}
```

is equivalent to

```
SUBS WZR, <Wn|WSP>, #<imm> {, <shift>}
```

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

```
CMP <Xn|SP>, #<imm>{, <shift>}
```

is equivalent to

```
SUBS XZR, <Xn|SP>, #<imm> {, <shift>}
```

and is always the preferred disassembly.

### Assembler symbols

`<Wn|WSP>` Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

`<Xn|SP>` Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

`<imm>` Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.

`<shift>` Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "shift" field. It can have the following values:

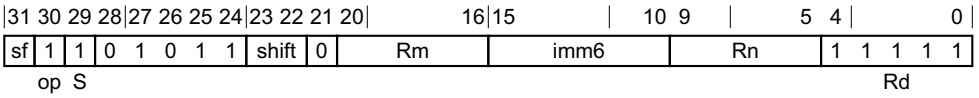
`LSL #0` when `shift = 00`

`LSL #12` when `shift = 01`

The encoding `shift = 1x` is reserved.

### Operation

The description of SUBS (immediate) gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.46 CMP (shifted register)

Compare (shifted register) subtracts an optionally-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the SUBS (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of SUBS (shifted register).
- The description of SUBS (shifted register) gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

```
CMP <Wn>, <Wm>{, <shift> #<amount>}
```

is equivalent to

```
SUBS WZR, <Wn>, <Wm> {, <shift> #<amount>}
```

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

```
CMP <Xn>, <Xm>{, <shift> #<amount>}
```

is equivalent to

```
SUBS XZR, <Xn>, <Xm> {, <shift> #<amount>}
```

and is always the preferred disassembly.

### Assembler symbols

`<Wn>` Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- `LSL` when `shift = 00`
- `LSR` when `shift = 01`
- `ASR` when `shift = 10`

The encoding `shift = 11` is reserved.

`<amount>` For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

## C6.6.47 CNEG

Conditional Negate returns, in the destination register, the negated value of the source register if the condition is TRUE, and otherwise returns the value of the source register.

This instruction is an alias of the CSNEG instruction. This means that:

- The encodings in this description are named to match the encodings of CSNEG.
- The description of CSNEG gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

`CNEG <Wd>, <Wn>, <cond>`

is equivalent to

`CSNEG <Wd>, <Wn>, <Wn>, invert(<cond>)`

and is the preferred disassembly when `Rn == Rm`.

### *64-bit variant*

Applies when `sf = 1`.

`CNEG <Xd>, <Xn>, <cond>`

is equivalent to

`CSNEG <Xd>, <Xn>, <Xn>, invert(<cond>)`

and is the preferred disassembly when `Rn == Rm`.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields. |
| `<cond>` | Is one of the standard conditions, excluding AL and NV, encoded in the "cond" field with its least significant bit inverted. |

### Operation

The description of CSNEG gives the operational pseudocode for this instruction.

## C6.6.48 CRC32B, CRC32H, CRC32W, CRC32X

CRC32 checksum performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, 32, or 64 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x04C11DB7 is used for the CRC calculation.

In ARMv8-A, this is an OPTIONAL instruction.

**Note**

ID_AA64ISAR0_EL1.CRC32 indicates whether this instruction is supported.

### CRC32B variant

Applies when sf = 0 && sz = 00.

```
CRC32B <Wd>, <Wn>, <Wm>
```

### CRC32H variant

Applies when sf = 0 && sz = 01.

```
CRC32H <Wd>, <Wn>, <Wm>
```

### CRC32W variant

Applies when sf = 0 && sz = 10.

```
CRC32W <Wd>, <Wn>, <Wm>
```

### CRC32X variant

Applies when sf = 1 && sz = 11.

```
CRC32X <Wd>, <Wn>, <Xm>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sf == '1' && sz != '11' then UnallocatedEncoding();
if sf == '0' && sz == '11' then UnallocatedEncoding();
integer size = 8 << UInt(sz);   // 2-bit size field -> 8, 16, 32, 64
boolean crc32c = (C == '1');
```

### Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose accumulator output register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the general-purpose accumulator input register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the general-purpose data source register, encoded in the "Rm" field. |
| <Wm> | Is the 32-bit name of the general-purpose data source register, encoded in the "Rm" field. |

Non-Confidential - Beta

## Operation

```
if !HaveCRCExt() then
    UnallocatedEncoding();

bits(32)      acc     = X[n];   // accumulator
bits(size)    val     = X[m];   // input value
bits(32)      poly    = (if crc32c then 0x1EDC6F41 else 0x04C11DB7)<31:0>;

bits(32+size) tempacc = BitReverse(acc) : Zeros(size);
bits(size+32) tempval = BitReverse(val) : Zeros(32);

// Poly32Mod2 on a bitstring does a polynomial Modulus over {0,1} operation
X[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));
```

## C6.6.49 CRC32CB, CRC32CH, CRC32CW, CRC32CX

CRC32 checksum performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, 32, or 64 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x1EDC6F41 is used for the CRC calculation.

In ARMv8-A, this is an OPTIONAL instruction.

**Note**

ID_AA64ISAR0_EL1.CRC32 indicates whether this instruction is supported.

### *CRC32CB variant*

Applies when sf = 0 && sz = 00.

```
CRC32CB <Wd>, <Wn>, <Wm>
```

### *CRC32CH variant*

Applies when sf = 0 && sz = 01.

```
CRC32CH <Wd>, <Wn>, <Wm>
```

### *CRC32CW variant*

Applies when sf = 0 && sz = 10.

```
CRC32CW <Wd>, <Wn>, <Wm>
```

### *CRC32CX variant*

Applies when sf = 1 && sz = 11.

```
CRC32CX <Wd>, <Wn>, <Xm>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sf == '1' && sz != '11' then UnallocatedEncoding();
if sf == '0' && sz == '11' then UnallocatedEncoding();
integer size = 8 << UInt(sz);   // 2-bit size field -> 8, 16, 32, 64
boolean crc32c = (C == '1');
```

### Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose accumulator output register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the general-purpose accumulator input register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the general-purpose data source register, encoded in the "Rm" field. |
| <Wm> | Is the 32-bit name of the general-purpose data source register, encoded in the "Rm" field. |

## C6.6.50 CSEL

Conditional Select returns, in the destination register, the value of the first source register if the condition is TRUE, and otherwise returns the value of the second source register.

### 32-bit variant

Applies when `sf = 0`.

```
CSEL <Wd>, <Wn>, <Wm>, <cond>
```

### 64-bit variant

Applies when `sf = 1`.

```
CSEL <Xd>, <Xn>, <Xm>, <cond>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
bits(4) condition = cond;
boolean else_inv = (op == '1');
boolean else_inc = (o2 == '1');
```

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Wm> | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| <cond> | Is one of the standard conditions, encoded in the "cond" field in the standard way. |

## Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];

if ConditionHolds(condition) then
    result = operand1;
else
    result = operand2;
    if else_inv then result = NOT(result);
    if else_inc then result = result + 1;

X[d] = result;
```

## C6.6.51 CSET

Conditional Set sets the destination register to 1 if the condition is TRUE, and otherwise sets it to 0.

This instruction is an alias of the CSINC instruction. This means that:

- The encodings in this description are named to match the encodings of CSINC.
- The description of CSINC gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

```
CSET <Wd>, <cond>
```

is equivalent to

```
CSINC <Wd>, WZR, WZR, invert(<cond>)
```

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

```
CSET <Xd>, <cond>
```

is equivalent to

```
CSINC <Xd>, XZR, XZR, invert(<cond>)
```

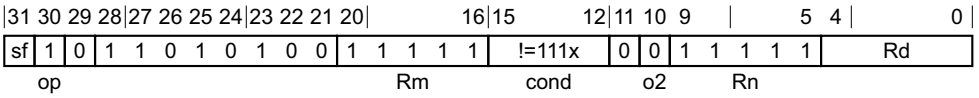
and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<cond>` | Is one of the standard conditions, excluding AL and NV, encoded in the "cond" field with its least significant bit inverted. |

### Operation

The description of CSINC gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.52 CSETM

Conditional Set Mask sets all bits of the destination register to 1 if the condition is TRUE, and otherwise sets all bits to 0.

This instruction is an alias of the CSINV instruction. This means that:

- The encodings in this description are named to match the encodings of CSINV.
- The description of CSINV gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0`.

```
CSETM <Wd>, <cond>
```

is equivalent to

```
CSINV <Wd>, WZR, WZR, invert(<cond>)
```

and is always the preferred disassembly.

#### *64-bit variant*

Applies when `sf = 1`.

```
CSETM <Xd>, <cond>
```

is equivalent to

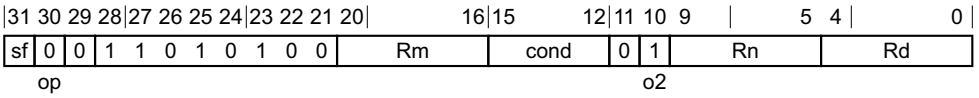
```
CSINV <Xd>, XZR, XZR, invert(<cond>)
```

and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<cond>` | Is one of the standard conditions, excluding AL and NV, encoded in the "cond" field with its least significant bit inverted. |

### Operation



The description of CSINV gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.53 CSINC

Conditional Select Increment returns, in the destination register, the value of the first source register if the condition is TRUE, and otherwise returns the value of the second source register incremented by 1.

This instruction is used by the aliases CINC and CSET. See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0`.

```
CSINC <Wd>, <Wn>, <Wm>, <cond>
```

### 64-bit variant

Applies when `sf = 1`.

```
CSINC <Xd>, <Xn>, <Xm>, <cond>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
bits(4) condition = cond;
boolean else_inv = (op == '1');
boolean else_inc = (o2 == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| CINC | `Rm != '11111' && cond != '111x' && Rn != '11111' && Rn == Rm` |
| CSET | `Rm == '11111' && cond != '111x' && Rn == '11111'` |

## Assembler symbols

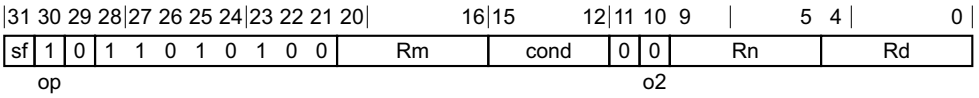
| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<cond>` | Is one of the standard conditions, encoded in the "cond" field in the standard way. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];

if ConditionHolds(condition) then
    result = operand1;
else
    result = operand2;
    if else_inv then result = NOT(result);
    if else_inc then result = result + 1;



X[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.54 CSINV

Conditional Select Invert returns, in the destination register, the value of the first source register if the condition is TRUE, and otherwise returns the bitwise inversion value of the second source register.

This instruction is used by the aliases CINV and CSETM. See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0`.

```
CSINV <Wd>, <Wn>, <Wm>, <cond>
```

### 64-bit variant

Applies when `sf = 1`.

```
CSINV <Xd>, <Xn>, <Xm>, <cond>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
bits(4) condition = cond;
boolean else_inv = (op == '1');
boolean else_inc = (o2 == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| CINV | `Rm != '11111' && cond != '111x' && Rn != '11111' && Rn == Rm` |
| CSETM | `Rm == '11111' && cond != '111x' && Rn == '11111'` |

## Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<cond>` | Is one of the standard conditions, encoded in the "cond" field in the standard way. |

## C6.6.55 CSNEG

Conditional Select Negation returns, in the destination register, the value of the first source register if the condition is TRUE, and otherwise returns the negated value of the second source register.

This instruction is used by the alias CNEG. See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0`.

```
CSNEG <Wd>, <Wn>, <Wm>, <cond>
```

### 64-bit variant

Applies when `sf = 1`.

```
CSNEG <Xd>, <Xn>, <Xm>, <cond>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
bits(4) condition = cond;
boolean else_inv = (op == '1');
boolean else_inc = (o2 == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| CNEG | `cond != '111x' && Rn == Rm` |

## Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<cond>` | Is one of the standard conditions, encoded in the "cond" field in the standard way. |

## C6.6.56 DC

Data Cache operation. For more information, see A64 system instructions for cache maintenance.

This instruction is an alias of the SYS instruction. This means that:

- The encodings in this description are named to match the encodings of SYS.
- The description of SYS gives the operational pseudocode for this instruction.

### *System variant*

```
DC <dc_op>, <Xt>
```

is equivalent to

```
SYS #<op1>, C7, <Cm>, #<op2>, <Xt>
```

and is the preferred disassembly when `SysOp(op1,'0111',CRm,op2) == Sys_DC`.

### Assembler symbols

`<dc_op>` Is a DC operation name, as listed for the DC system operation group, encoded in the "op1:CRm:op2" field. It can have the following values:

| | |
|---|---|
| `IVAC` | when `op1 = 000, CRm = 0110, op2 = 001` |
| `ISW` | when `op1 = 000, CRm = 0110, op2 = 010` |
| `CSW` | when `op1 = 000, CRm = 1010, op2 = 010` |
| `CISW` | when `op1 = 000, CRm = 1110, op2 = 010` |
| `ZVA` | when `op1 = 011, CRm = 0100, op2 = 001` |
| `CVAC` | when `op1 = 011, CRm = 1010, op2 = 001` |
| `CVAU` | when `op1 = 011, CRm = 1011, op2 = 001` |
| `CIVAC` | when `op1 = 011, CRm = 1110, op2 = 001` |

`<op1>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.

`<Cm>` Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.

`<op2>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

`<Xt>` Is the 64-bit name of the general-purpose source register, encoded in the "Rt" field.

### Operation

The description of SYS gives the operational pseudocode for this instruction.

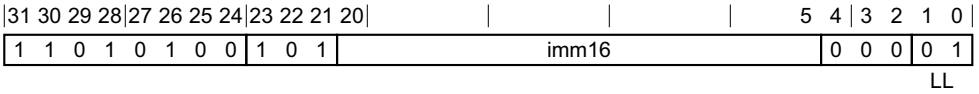
## C6.6.57 DCPS1



Debug Change PE State to EL1 allows the debugger to move the PE into EL1 from a lower Exception Level or to a specific mode at the current Exception Level.

If the PE is at EL1 or lower, then the PE enters EL1h.

If the PE is at an Exception Level higher than EL1, then the PE does not change Exception Level but selects use of the stack pointer for the current Exception Level by updating PSTATE.SP.

This instruction is always UNDEFINED in Non-debug state.

For more information on the operation of this instructions, see DCPS.

### *System variant*

```
DCPS1 {#<imm>}
```

### *Decode for this encoding*

```
bits(2) target_level = LL;
if LL == '00' then UnallocatedEncoding();
if !Halted() then AArch64.UndefinedFault();
```

### Assembler symbols

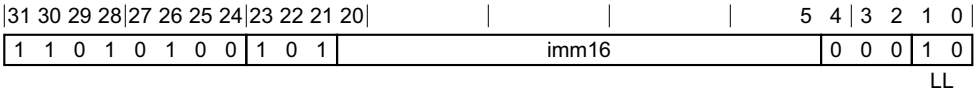
<imm> Is an optional 16-bit unsigned immediate, in the range 0 to 65535, defaulting to 0 and encoded in the "imm16" field.

### Operation

```
DCPSInstruction(target_level);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.58 DCPS2



Debug Change PE State to EL2 allows the debugger to move the PE into EL2 from a lower Exception Level or to a specific mode at the current Exception Level.

If the PE is at EL2 or lower, then the PE enters EL2h.

If the PE is at an Exception Level higher than EL2, then the PE does not change Exception Level but selects use of the stack pointer for the current Exception Level by updating PSTATE.SP.

This instruction is always UNDEFINED in Non-debug state.

For more information on the operation of this instructions, see DCPS.

### *System variant*

```
DCPS2 {#<imm>}
```

### *Decode for this encoding*

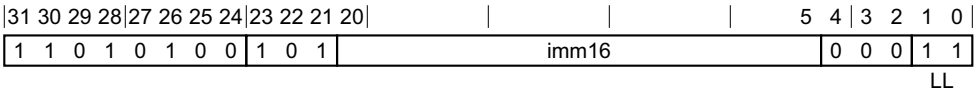
```
bits(2) target_level = LL;
if LL == '00' then UnallocatedEncoding();
if !Halted() then AArch64.UndefinedFault();
```

### Assembler symbols

<imm> Is an optional 16-bit unsigned immediate, in the range 0 to 65535, defaulting to 0 and encoded in the "imm16" field.

### Operation

```
DCPSInstruction(target_level);
```



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.59 DCPS3

Debug Change PE State to EL3 allows the debugger to move the PE into EL3 from a lower Exception Level or to a specific mode at the current Exception Level. The PE enters EL3h.

This instruction is always UNDEFINED in Non-debug state.

For more information on the operation of this instructions, see DCPS.

### *System variant*

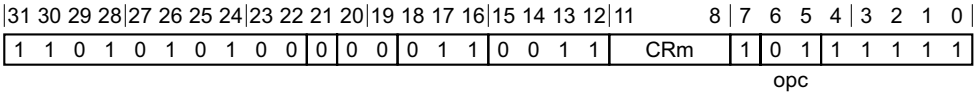
```
DCPS3 {#<imm>}
```

### *Decode for this encoding*

```
bits(2) target_level = LL;
if LL == '00' then UnallocatedEncoding();
if !Halted() then AArch64.UndefinedFault();
```

### Assembler symbols

<imm> Is an optional 16-bit unsigned immediate, in the range 0 to 65535, defaulting to 0 and encoded in the "imm16" field.



### Operation

```
DCPSInstruction(target_level);
```

## C6.6.60 DMB

Data Memory Barrier is a memory barrier that ensures the ordering of observations of memory accesses, see *Data Memory Barrier (DMB)* on page B2-87.

### System variant

```
DMB <option>|#<imm>
```

### Decode for this encoding

```
MemBarrierOp op;
MBReqDomain domain;
MBReqTypes types;

case opc of
    when '00' op = MemBarrierOp_DSB;

Non-Confidential - Beta

ISHLD — Inner Shareable is the required shareability domain, reads are the required access type in *Group A* on page B2-87, and reads and writes are the required access types in *Group B* on page B2-87. Encoded as CRm = 0b1001.

NSH — Non-shareable is the required shareability domain, reads and writes are the required access types in both *Group A* on page B2-87 and *Group B* on page B2-87. Encoded as CRm = 0b0111.

NSHST — Non-shareable is the required shareability domain, writes are the required access type in both *Group A* on page B2-87 and *Group B* on page B2-87. Encoded as CRm = 0b0110.

NSHLD — Non-shareable is the required shareability domain, reads are the required access type in *Group A* on page B2-87, and reads and writes are the required access types in *Group B* on page B2-87. Encoded as CRm = 0b0101.

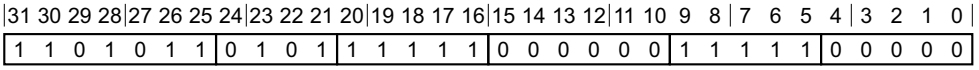
OSH — Outer Shareable is the required shareability domain, reads and writes are the required access types in both *Group A* on page B2-87 and *Group B* on page B2-87. Encoded as CRm = 0b0011.

OSHST — Outer Shareable is the required shareability domain, writes are the required access type in both *Group A* on page B2-87 and *Group B* on page B2-87. Encoded as CRm = 0b0010.

OSHLD — Outer Shareable is the required shareability domain, reads are the required access type in *Group A* on page B2-87, and reads and writes are the required access types in *Group B* on page B2-87. Encoded as CRm = 0b0001.

All other encodings of CRm that are not listed above are reserved, and can be encoded using the #<imm> syntax. It is IMPLEMENTATION DEFINED whether options other than SY are implemented. All unsupported and reserved options must execute as a full system operation, but software must not rely on this behavior.

<imm> — Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "CRm" field.



## Operation

```
case op of
    when MemBarrierOp_DSB
        DataSynchronizationBarrier(domain, types);
    when MemBarrierOp_DMB
        DataMemoryBarrier(domain, types);
    when MemBarrierOp_ISB
        InstructionSynchronizationBarrier();

## C6.6.63 EON (shifted register)

Bitwise Exclusive OR NOT (shifted register) performs a bitwise Exclusive OR NOT of a register value and an optionally-shifted register value, and writes the result to the destination register.

### 32-bit variant

Applies when `sf = 0`.

```
EON <Wd>, <Wn>, <Wm>{, <shift> #<amount>}
```

### 64-bit variant

Applies when `sf = 1`.

```
EON <Xd>, <Xn>, <Xm>{, <shift> #<amount>}
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean setflags;
LogicalOp op;
case opc of
    when '00' op = LogicalOp_AND; setflags = FALSE;
    when '01' op = LogicalOp_ORR; setflags = FALSE;
    when '10' op = LogicalOp_EOR; setflags = FALSE;
    when '11' op = LogicalOp_AND; setflags = TRUE;

if sf == '0' && imm6<5> == '1' then ReservedValue();

ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
boolean invert = (N == '1');
```

## Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- `LSL` when `shift = 00`
- `LSR` when `shift = 01`
- `ASR` when `shift = 10`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

ROR when shift = 11

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

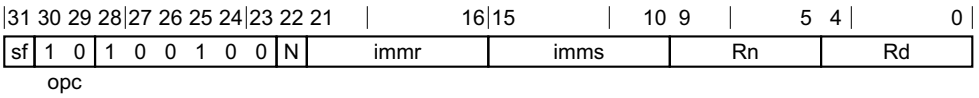
For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);

if invert then operand2 = NOT(operand2);

case op of
    when LogicalOp_AND result = operand1 AND operand2;
    when LogicalOp_ORR result = operand1 OR  operand2;
    when LogicalOp_EOR result = operand1 EOR operand2;



if setflags then
    PSTATE.<N,Z,C,V> = result<datasize-1>:IsZeroBit(result):'00';

X[d] = result;
```

## C6.6.64 EOR (immediate)

Bitwise Exclusive OR (immediate) performs a bitwise Exclusive OR of a register value and an immediate value, and writes the result to the destination register.

### *32-bit variant*

Applies when `sf = 0 && N = 0`.

```
EOR <Wd|WSP>, <Wn>, #<imm>
```

### *64-bit variant*

Applies when `sf = 1`.

```
EOR <Xd|SP>, <Xn>, #<imm>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
boolean setflags;
LogicalOp op;
case opc of
    when '00' op = LogicalOp_AND; setflags = FALSE;
    when '01' op = LogicalOp_ORR; setflags = FALSE;
    when '10' op = LogicalOp_EOR; setflags = FALSE;
    when '11' op = LogicalOp_AND; setflags = TRUE;

bits(datasize) imm;
if sf == '0' && N != '0' then ReservedValue();
(imm, -) = DecodeBitMasks(N, imms, immr, TRUE);
```

## Assembler symbols

## C6.6.66 ERET

Exception Return using the ELR and SPSR for the current Exception level. When executed, the PE restores PSTATE from the SPSR, and branches to the address held in the ELR.

The PE checks the SPSR for the current Exception level for an illegal return event. See *Illegal return events from AArch64 state* on page D1-1553.

ERET will cause an Undefined Instruction exception if executed in EL0.

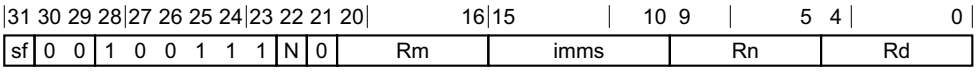
### *System variant*

ERET

### *Decode for this encoding*

```
if PSTATE.EL == EL0 then UnallocatedEncoding();
```

### Operation



```
AArch64.ExceptionReturn(ELR[], SPSR[]);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.67 EXTR

Extract register extracts a register from a pair of registers.

This instruction is used by the alias ROR (immediate). See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0 && N = 0 && imms = 0xxxxx`.

```
EXTR <Wd>, <Wn>, <Wm>, #<lsb>
```

### 64-bit variant

Applies when `sf = 1 && N = 1`.

```
EXTR <Xd>, <Xn>, <Xm>, #<lsb>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
integer lsb;

if N != sf then UnallocatedEncoding();
if sf == '0' && imms<5> == '1' then ReservedValue();
lsb = UInt(imms);
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| ROR (immediate) | `Rn == Rm` |

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Wm> | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| <lsb> | For the 32-bit variant: is the least significant bit position from which to extract, in the range 0 to 31, encoded in the "imms" field.<br>For the 64-bit variant: is the least significant bit position from which to extract, in the range 0 to 63, encoded in the "imms" field. |

## C6.6.68 HINT

Hint instruction.

This instruction is used by the aliases NOP, SEVL, SEV, WFE, WFI, and YIELD. See the *Alias conditions* table for details of when each alias is preferred.

### *System variant*

```
HINT #<imm>
```

### *Decode for this encoding*

```
SystemHintOp op;

case CRm:op2 of
    when '0000 000' op = SystemHintOp_NOP;
    when '0000 001' op = SystemHintOp_YIELD;
    when '0000 010' op = SystemHintOp_WFE;
    when '0000 011' op = SystemHintOp_WFI;
    when '0000 100' op = SystemHintOp_SEV;
    when '0000 101' op = SystemHintOp_SEVL;
    otherwise  op = SystemHintOp_NOP;
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| NOP | `CRm == '0000' && op2 == '000'` |
| SEVL | `CRm == '0000' && op2 == '101'` |
| SEV | `CRm == '0000' && op2 == '100'` |
| WFE | `CRm == '0000' && op2 == '010'` |
| WFI | `CRm == '0000' && op2 == '011'` |
| YIELD | `CRm == '0000' && op2 == '001'` |

## Assembler symbols

<imm> Is a 7-bit unsigned immediate, in the range 0 to 127, encoded in "CRm:op2".

## Operation

```
case op of
    when SystemHintOp_YIELD
        Hint_Yield();

    when SystemHintOp_WFE
        if EventRegistered() then
            ClearEventRegister();
        else

## C6.6.69 HLT

Halt instruction causes a Halting Instruction debug event to occur.

### *System variant*

```
HLT #<imm>
```

### *Decode for this encoding*

```
if EDSCR.HDE == '0' || !HaltingAllowed() then UndefinedFault();
```

### Assembler symbols

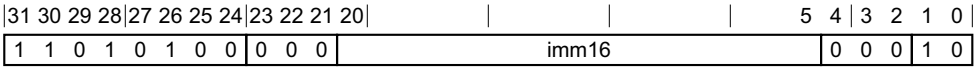
<imm> Is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.

### Operation

```
Halt(DebugHalt_HaltInstruction);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.70 HVC



Hypervisor Call causes an exception to EL2. Non-secure software executing at EL1 can use this instruction to call the hypervisor to request a service.

The HVC instruction:

- Is UNDEFINED in ELO, and Secure EL1.
- When SCR_EL3.HCE is set to 0, generates an Undefined Instruction exception.

On executing an HVC instruction, the PE records the exception as a Hypervisor Call exception, using the EC value 0x16, and the value of the immediate argument. This is reported in:

- ESR_ELx, if the exception is taken to an Exception level that is using AArch64.
- HSR, if the exception is taken to an Exception level that is using AArch32. See *Use of the HSR* on page G4-4105.

#### *System variant*

```
HVC #<imm>
```

#### *Decode for this encoding*

```
bits(16) imm = imm16;
```

### Assembler symbols

<imm> Is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.

### Operation

```
if !HaveEL(EL2) || PSTATE.EL == EL0 || (PSTATE.EL == EL1 && IsSecure()) then
    UnallocatedEncoding();

hvc_enable = if HaveEL(EL3) then SCR_EL3.HCE else NOT(HCR_EL2.HCD);
if hvc_enable == '0' then
    AArch64.UndefinedFault();
else
    AArch64.CallHypervisor(imm);
```

## C6.6.71 IC

Instruction Cache operation. For more information, see A64 system instructions for cache maintenance.

This instruction is an alias of the SYS instruction. This means that:

- The encodings in this description are named to match the encodings of SYS.
- The description of SYS gives the operational pseudocode for this instruction.

### *System variant*

```
IC <ic_op>{, <Xt>}
```

is equivalent to

```
SYS #<op1>, C7, <Cm>, #<op2>{, <Xt>}
```

and is the preferred disassembly when `SysOp(op1,'0111',CRm,op2) == Sys_IC`.

### Assembler symbols

`<ic_op>` Is an IC operation name, as listed for the IC system operation pages, encoded in the "op1:CRm:op2" field. It can have the following values:

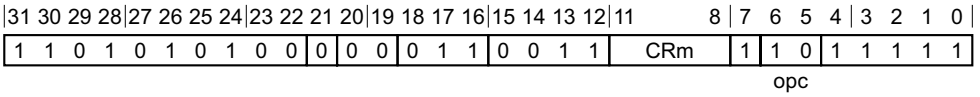
| | |
|---|---|
| `IALLUIS` | when `op1 = 000`, `CRm = 0001`, `op2 = 000` |
| `IALLU` | when `op1 = 000`, `CRm = 0101`, `op2 = 000` |
| `IVAU` | when `op1 = 011`, `CRm = 0101`, `op2 = 001` |

`<op1>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.

`<Cm>` Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.

`<op2>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

`<Xt>` Is the 64-bit name of the optional general-purpose source register, defaulting to '11111', encoded in the "Rt" field.



### Operation

The description of SYS gives the operational pseudocode for this instruction.

### C6.6.72 ISB

Instruction Synchronization Barrier flushes the pipeline in the PE, so that all instructions following the `ISB` are fetched from cache or memory, after the instruction has been completed. It ensures that the effects of context changing operations executed before the `ISB` instruction are visible to the instructions fetched after the `ISB`. Context changing operations include changing the ASID, TLB maintenance instructions, and all changes to the System registers. In addition, any branches that appear in program order after the `ISB` instruction are written into the branch prediction logic with the context that is visible after the `ISB` instruction. This is needed to ensure correct execution of the instruction stream. For more information, see *Memory barriers* on page B2-86.

#### *System variant*

```
ISB {<option>|#<imm>}
```

#### *Decode for this encoding*

```
MemBarrierOp op;
MBReqDomain domain;
MBReqTypes types;

case opc of
    when '00' op = MemBarrierOp_DSB;
    when '01' op = MemBarrierOp_DMB;
    when '10' op = MemBarrierOp_ISB;
    otherwise UnallocatedEncoding();

case CRm<3:2> of
    when '00' domain = MBReqDomain_OuterShareable;
    when '01' domain = MBReqDomain_Nonshareable;
    when '10' domain = MBReqDomain_InnerShareable;
    when '11' domain = MBReqDomain_FullSystem;

case CRm<1:0> of
    when '01' types = MBReqTypes_Reads;
    when '10' types = MBReqTypes_Writes;
    when '11' types = MBReqTypes_All;
    otherwise
        types = MBReqTypes_All;
        domain = MBReqDomain_FullSystem;
```

### Assembler symbols

`<option>` Specifies an optional limitation on the barrier operation. Values are:

`SY` Full system barrier operation, encoded as `CRm` = `0b1111`. Can be omitted.

All other encodings of `CRm` are reserved. The corresponding instructions execute as full system barrier operations, but must not be relied upon by software.

`<imm>` Is an optional 4-bit unsigned immediate, in the range 0 to 15, defaulting to 15 and encoded in the "CRm" field.

### Operation

```
case op of
    when MemBarrierOp_DSB
        DataSynchronizationBarrier(domain, types);
```

### C6.6.73 LDAR

Load-Acquire Register derives an address from a base register value, loads a 32-bit word or 64-bit doubleword from memory, and writes it to a register. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

#### *32-bit variant*

Applies when `size = 10`.

```
LDAR <Wt>, [<Xn|SP>{,#0}]
```

#### *64-bit variant*

Applies when `size = 11`.

```
LDAR <Xt>, [<Xn|SP>{,#0}]
```

#### *Decode for all variants of this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

if o0 == '0' then UnallocatedEncoding();

AccType acctype = AccType_ORDERED;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = elsize;
```

### Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xt>` | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xn\|SP>` | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |

### Operation

```
bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

## C6.6.74 LDARB

Load-Acquire Register Byte derives an address from a base register value, loads a byte from memory, zero-extends it and writes it to a register. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### *No offset variant*

```
LDARB <Wt>, [<Xn|SP>{,#0}]
```

### *Decode for this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

if o0 == '0' then UnallocatedEncoding();

AccType acctype = AccType_ORDERED;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = elsize;
```

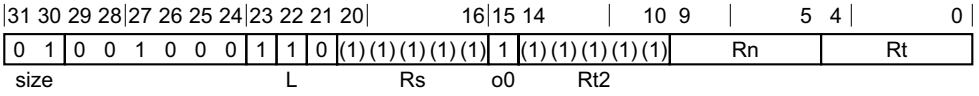
### Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |

### Operation

```
bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];



case memop of
    when MemOp_STORE
        data = X[t];
        Mem[address, dbytes, acctype] = data;

    when MemOp_LOAD
        data = Mem[address, dbytes, acctype];
        X[t] = ZeroExtend(data, regsize);
```

## C6.6.75 LDARH

Load-Acquire Register Halfword derives an address from a base register value, loads a halfword from memory, zero-extends it, and writes it to a register. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### *No offset variant*

```
LDARH <Wt>, [<Xn|SP>{,#0}]
```

### *Decode for this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

if o0 == '0' then UnallocatedEncoding();

AccType acctype = AccType_ORDERED;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = elsize;
```

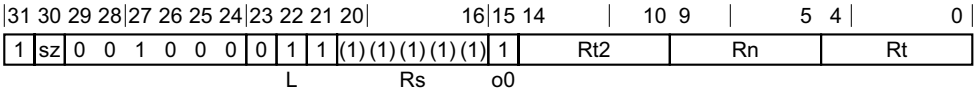
## Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |

## Operation

```
bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];



case memop of
    when MemOp_STORE
        data = X[t];
        Mem[address, dbytes, acctype] = data;

    when MemOp_LOAD
        data = Mem[address, dbytes, acctype];
        X[t] = ZeroExtend(data, regsize);
```

## C6.6.76 LDAXP

Load-Acquire Exclusive Pair of Registers derives an address from a base register value, loads two 32-bit words or two 64-bit doublewords from memory, and writes them to two registers. A 32-bit pair requires the address to be doubleword aligned and is single-copy atomic at doubleword granularity. A 64-bit pair requires the address to be quadword aligned and is single-copy atomic for each doubleword at doubleword granularity. The PE marks the physical address being accessed as an exclusive access. This exclusive access mark is checked by Store Exclusive instructions. See *Synchronization and semaphores* on page B2-107. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### 32-bit variant

Applies when `sz = 0`.

```
LDAXP <Wt1>, <Wt2>, [<Xn|SP>{,#0}]
```

### 64-bit variant

Applies when `sz = 1`.

```
LDAXP <Xt1>, <Xt2>, [<Xn|SP>{,#0}]
```

### Decode for all variants of this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = TRUE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 32 << UInt(sz);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDAXP* on page K1-5505.

## Assembler symbols

| | |
|---|---|
| `<Wt1>` | Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Wt2>` | Is the 32-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field. |
| `<Xt1>` | Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xt2>` | Is the 64-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field. |
| `<Xn\|SP>` | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |

## C6.6.77 LDAXR

Load-Acquire Exclusive Register derives an address from a base register value, loads a 32-bit word or 64-bit doubleword from memory, and writes it to a register. The memory access is atomic. The PE marks the physical address being accessed as an exclusive access. This exclusive access mark is checked by Store Exclusive instructions. See *Synchronization and semaphores* on page B2-107. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### *32-bit variant*

Applies when `size = 10`.

```
LDAXR <Wt>, [<Xn|SP>{,#0}]
```

### *64-bit variant*

Applies when `size = 11`.

```
LDAXR <Xt>, [<Xn|SP>{,#0}]
```

### *Decode for all variants of this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = FALSE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

## C6.6.78 LDAXRB

Load-Acquire Exclusive Register Byte derives an address from a base register value, loads a byte from memory, zero-extends it and writes it to a register. The memory access is atomic. The PE marks the physical address being accessed as an exclusive access. This exclusive access mark is checked by Store Exclusive instructions. See *Synchronization and semaphores* on page B2-107. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### *No offset variant*

```
LDAXRB <Wt>, [<Xn|SP>{,#0}]
```

### *Decode for this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = FALSE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

## Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |

## Operation

## C6.6.80 LDNP

Load Pair of Registers, with non-temporal hint, calculates an address from a base register value and an immediate offset, loads two 32-bit words or two 64-bit doublewords from memory, and writes them to two registers.

For information about memory accesses, see *Load/Store addressing modes* on page C1-126. For information about Non-temporal pair instructions, see *Load/Store Non-temporal Pair* on page C3-145.

### 32-bit variant

Applies when opc = 00.

```
LDNP <Wt1>, <Wt2>, [<Xn|SP>{, #<imm>}]
```

### 64-bit variant

Applies when opc = 10.

```
LDNP <Xt1>, <Xt2>, [<Xn|SP>{, #<imm>}]
```

### Decode for all variants of this encoding

```
boolean wback  = FALSE;
boolean postindex = FALSE;
```

## Assembler symbols

| | |
|---|---|
| <Wt1> | Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field. |

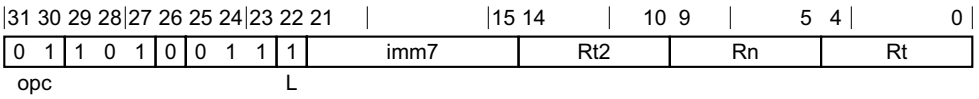
## C6.6.82 LDPSW

Load Pair of Registers Signed Word calculates an address from a base register value and an immediate offset, loads two 32-bit words from memory, sign-extends them, and writes them to two registers. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### Post-index



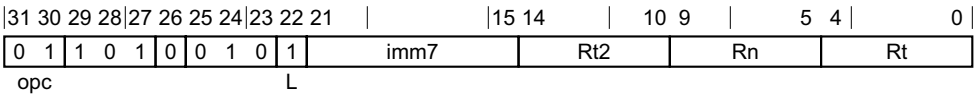
#### *Post-index variant*

```
LDPSW <Xt1>, <Xt2>, [<Xn|SP>], #<imm>
```

#### *Decode for this encoding*

```
boolean wback  = TRUE;
boolean postindex = TRUE;
```

### Pre-index



#### *Pre-index variant*

```
LDPSW <Xt1>, <Xt2>, [<Xn|SP>, #<imm>]!
```

#### *Decode for this encoding*

```
boolean wback  = TRUE;
boolean postindex = FALSE;
```

### Signed offset

#### *Signed offset variant*

```
LDPSW <Xt1>, <Xt2>, [<Xn|SP>{, #<imm>}]
```

#### *Decode for this encoding*

```
boolean wback  = FALSE;
boolean postindex = FALSE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDPSW* on page K1-5507.

### Assembler symbols

<Xt1> Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.

<Xt2> Is the 64-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> For the post-index and pre-index variant: is the signed immediate byte offset, a multiple of 4 in the range -256 to 252, encoded in the "imm7" field as <imm>/4.

For the signed offset variant: is the optional signed immediate byte offset, a multiple of 4 in the range -256 to 252, defaulting to 0 and encoded in the "imm7" field as <imm>/4.

### Shared decode for all encodings

```

## C6.6.83 LDR (immediate)

Load Register (immediate) calculates an address from a base register value and an immediate offset, loads a 32-bit word or 64-bit doubleword from memory, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126. The Unsigned offset variant scales the immediate offset value by the size of the value accessed before adding it to the base register value.

### Post-index

#### *32-bit variant*

Applies when `size = 10`.

```
LDR <Wt>, [<Xn|SP>], #<simm>
```

#### *64-bit variant*

Applies when `size = 11`.

```
LDR <Xt>, [<Xn|SP>], #<simm>
```

#### *Decode for all variants of this encoding*

```
boolean wback = TRUE;
boolean postindex = TRUE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Pre-index

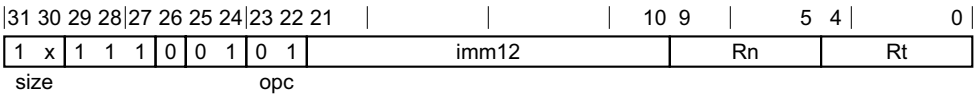
#### *32-bit variant*

Applies when `size = 10`.

```
LDR <Wt>, [<Xn|SP>, #<simm>]!
```

#### *64-bit variant*

Applies when `size = 11`.



```
LDR <Xt>, [<Xn|SP>, #<simm>]!
```

#### *Decode for all variants of this encoding*

```
boolean wback = TRUE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Unsigned offset

#### *32-bit variant*

Applies when `size = 10`.

```
LDR <Wt>, [<Xn|SP>{, #<pimm>}]
```

#### *64-bit variant*

Applies when `size = 11`.

```
LDR <Xt>, [<Xn|SP>{, #<pimm>}]
```

#### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = LSL(ZeroExtend(imm12, 64), scale);
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDR (immediate)* on page K1-5507.

### Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |

## C6.6.84 LDR (literal)

Load Register (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *32-bit variant*

Applies when `opc = 00`.

```
LDR <Wt>, <label>
```

### *64-bit variant*

Applies when `opc = 01`.

```
LDR <Xt>, <label>
```

### *Decode for all variants of this encoding*

```
integer t = UInt(Rt);
MemOp memop = MemOp_LOAD;
boolean signed = FALSE;
integer size;
bits(64) offset;

case opc of
    when '00'
        size = 4;
    when '01'
        size = 8;
    when '10'
        size = 4;
        signed = TRUE;
    when '11'
        memop = MemOp_PREFETCH;

offset = SignExtend(imm19:'00', 64);
```

## Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field. |
| `<Xt>` | Is the 64-bit name of the general-purpose register to be loaded, encoded in the "Rt" field. |
| `<label>` | Is the program label from which the data is to be loaded. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4. |

## Operation

```
bits(64) address = PC[] + offset;
bits(size*8) data;

case memop of
    when MemOp_LOAD
        data = Mem[address, size, AccType_NORMAL];
        if signed then

## C6.6.85 LDR (register)

Load Register (register) calculates an address from a base register value and an offset register value, loads a word from memory, and writes it to a register. The offset register value can optionally be shifted and extended. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *32-bit variant*

Applies when `size = 10`.

```
LDR <Wt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### *64-bit variant*

Applies when `size = 11`.

```
LDR <Xt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

## Assembler symbols

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xt>` Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

`<Wm>` When `option<0>` is set to `0`, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

`<Xm>` When `option<0>` is set to `1`, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

`<extend>` Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:

- `UXTW` when `option = 010`
- `LSL` when `option = 011`
- `SXTW` when `option = 110`
- `SXTX` when `option = 111`

`<amount>` For the 32-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

- `#0` when `S = 0`
- `#2` when `S = 1`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For the 64-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

`#0` when `S = 0`

`#3` when `S = 1`

### Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);
AccType acctype = AccType_NORMAL;
MemOp memop;

## C6.6.86 LDRB (immediate)

Load Register Byte (immediate) calculates an address from a base register value and an immediate offset, loads a byte from memory, zero-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### Post-index

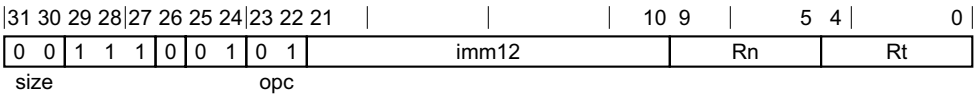
#### *Post-index variant*

```
LDRB <Wt>, [<Xn|SP>], #<simm>
```

#### *Decode for this encoding*

```
boolean wback = TRUE;
boolean postindex = TRUE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Pre-index



#### *Pre-index variant*

```
LDRB <Wt>, [<Xn|SP>, #<simm>]!
```

#### *Decode for this encoding*

```
boolean wback = TRUE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Unsigned offset

#### *Unsigned offset variant*

```
LDRB <Wt>, [<Xn|SP>{, #<pimm>}]
```

#### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = LSL(ZeroExtend(imm12, 64), scale);
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRB (immediate)* on page K1-5508.

### Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| <simm> | Is the signed immediate byte offset, in the range -256 to 255, encoded in the "imm9" field. |
| <pimm> | Is the optional positive immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. |

### Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;
integer regsize;

## C6.6.87 LDRB (register)

Load Register Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, zero-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *Extended register variant*

Applies when `option != 011`.

```
LDRB <Wt>, [<Xn|SP>, (<Wm>|<Xm>), <extend> {<amount>}]
```

### *Shifted register variant*

Applies when `option = 011`.

```
LDRB <Wt>, [<Xn|SP>, <Xm>{, LSL <amount>}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

## Assembler symbols

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

`<Wm>` When `option<0>` is set to `0`, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

`<Xm>` When `option<0>` is set to `1`, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

`<extend>` Is the index extend specifier, encoded in the "option" field. It can have the following values:

- `UXTW` when `option = 010`
- `SXTW` when `option = 110`
- `SXTX` when `option = 111`

`<amount>` Is the index shift amount, it must be `#0`, encoded in "S" as `0` if omitted, or as `1` if present.

## Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);
AccType acctype = AccType_NORMAL;
MemOp memop;

## C6.6.88 LDRH (immediate)

Load Register Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, zero-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### Post-index

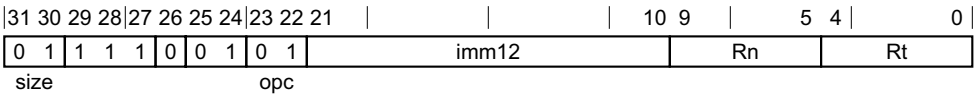
#### *Post-index variant*

```
LDRH <Wt>, [<Xn|SP>], #<simm>
```

#### *Decode for this encoding*

```
boolean wback = TRUE;
boolean postindex = TRUE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Pre-index



#### *Pre-index variant*

```
LDRH <Wt>, [<Xn|SP>, #<simm>]!
```

#### *Decode for this encoding*

```
boolean wback = TRUE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Unsigned offset

#### *Unsigned offset variant*

```
LDRH <Wt>, [<Xn|SP>{, #<pimm>}]
```

#### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = LSL(ZeroExtend(imm12, 64), scale);
```

## C6.6.89 LDRH (register)

Load Register Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, zero-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### 32-bit variant

```
LDRH <Wt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### Decode for this encoding

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRH (register)* on page K1-5447.

## Assembler symbols

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

`<Wm>` When `option<0>` is set to `0`, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

`<Xm>` When `option<0>` is set to `1`, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

`<extend>` Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:

- `UXTW` when `option = 010`
- `LSL` when `option = 011`
- `SXTW` when `option = 110`
- `SXTX` when `option = 111`

`<amount>` Is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

- `#0` when `S = 0`
- `#1` when `S = 1`

## C6.6.90 LDRSB (immediate)

Load Register Signed Byte (immediate) calculates an address from a base register value and an immediate byte offset, loads a byte from memory, sign-extends it to either 32 or 64 bits, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### Post-index

#### *32-bit variant*

Applies when `opc = 11`.

```
LDRSB <Wt>, [<Xn|SP>], #<simm>
```

#### *64-bit variant*

Applies when `opc = 10`.

```
LDRSB <Xt>, [<Xn|SP>], #<simm>
```

#### *Decode for all variants of this encoding*

```
boolean wback = TRUE;
boolean postindex = TRUE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Pre-index

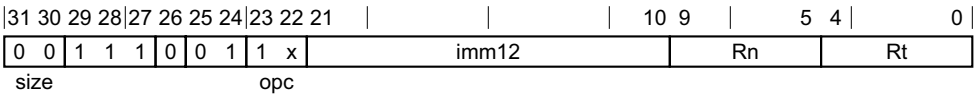
#### *32-bit variant*

Applies when `opc = 11`.

```
LDRSB <Wt>, [<Xn|SP>, #<simm>]!
```

#### *64-bit variant*

Applies when `opc = 10`.



```
LDRSB <Xt>, [<Xn|SP>, #<simm>]!
```

#### *Decode for all variants of this encoding*

```
boolean wback = TRUE;
boolean postindex = FALSE;

## C6.6.91 LDRSB (register)

Load Register Signed Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, sign-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *32-bit with extended register offset variant*

Applies when `opc = 11 && option != 011`.

```
LDRSB <Wt>, [<Xn|SP>, (<Wm>|<Xm>), <extend> {<amount>}]
```

### *32-bit with shifted register offset variant*

Applies when `opc = 11 && option = 011`.

```
LDRSB <Wt>, [<Xn|SP>, <Xm>{, LSL <amount>}]
```

### *64-bit with extended register offset variant*

Applies when `opc = 10 && option != 011`.

```
LDRSB <Xt>, [<Xn|SP>, (<Wm>|<Xm>), <extend> {<amount>}]
```

### *64-bit with shifted register offset variant*

Applies when `opc = 10 && option = 011`.

```
LDRSB <Xt>, [<Xn|SP>, <Xm>{, LSL <amount>}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

## Assembler symbols

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xt>` Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

`<Wm>` When `option<0>` is set to `0`, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

`<Xm>` When `option<0>` is set to `1`, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

`<extend>` Is the index extend specifier, encoded in the "option" field. It can have the following values:

- `UXTW` when `option = 010`
- `SXTW` when `option = 110`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

SXTX when option = 111

<amount> Is the index shift amount, it must be #0, encoded in "S" as 0 if omitted, or as 1 if present.

## Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);
AccType acctype = AccType_NORMAL;
MemOp memop;

## C6.6.92 LDRSH (immediate)

Load Register Signed Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, sign-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### Post-index

#### *32-bit variant*

Applies when `opc = 11`.

```
LDRSH <Wt>, [<Xn|SP>], #<simm>
```

#### *64-bit variant*

Applies when `opc = 10`.

```
LDRSH <Xt>, [<Xn|SP>], #<simm>
```

#### *Decode for all variants of this encoding*

```
boolean wback = TRUE;
boolean postindex = TRUE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Pre-index

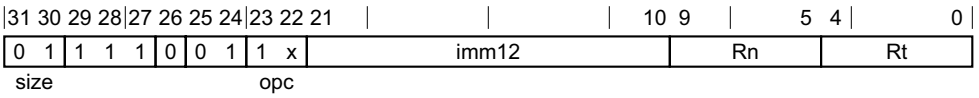
#### *32-bit variant*

Applies when `opc = 11`.

```
LDRSH <Wt>, [<Xn|SP>, #<simm>]!
```

#### *64-bit variant*

Applies when `opc = 10`.



```
LDRSH <Xt>, [<Xn|SP>, #<simm>]!
```

#### *Decode for all variants of this encoding*

```
boolean wback = TRUE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

## C6.6.93 LDRSH (register)

Load Register Signed Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, sign-extends it, and writes it to a register. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### 32-bit variant

Applies when opc = 11.

```
LDRSH <Wt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### 64-bit variant

Applies when opc = 10.

```
LDRSH <Xt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### Decode for all variants of this encoding

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

## Assembler symbols

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Wm> When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

<Xm> When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

<extend> Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:

- UXTW when option = 010
- LSL when option = 011
- SXTW when option = 110
- SXTX when option = 111

<amount> Is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

- #0 when S = 0
- #1 when S = 1

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRSW (immediate)* on page K1-5509.

### Assembler symbols

| | |
|---|---|
| <Xt> | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| <simm> | Is the signed immediate byte offset, in the range -256 to 255, encoded in the "imm9" field. |
| <pimm> | Is the optional positive immediate byte offset, a multiple of 4 in the range 0 to 16380, defaulting to 0 and encoded in the "imm12" field as <pimm>/4. |

### Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then
    // store or zero-extending load
    memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;
    regsize = if size == '11' then 64 else 32;
    signed = FALSE;
else
    if size == '11' then
        UnallocatedEncoding();
    else
        // sign-extending load
        memop = MemOp_LOAD;
        if size == '10' && opc<0> == '1' then UnallocatedEncoding();
        regsize = if opc<0> == '1' then 32 else 64;
        signed = TRUE;

integer datasize = 8 << scale;
```

### Operation for all encodings

```
bits(64) address;
bits(datasize) data;

## C6.6.95 LDRSW (literal)

Load Register Signed Word (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes on page C1-126*.

### *Literal variant*

```
LDRSW <Xt>, <label>
```

### *Decode for this encoding*

```
integer t = UInt(Rt);
MemOp memop = MemOp_LOAD;
boolean signed = FALSE;
integer size;
bits(64) offset;

case opc of
    when '00'
        size = 4;
    when '01'
        size = 8;
    when '10'
        size = 4;
        signed = TRUE;
    when '11'
        memop = MemOp_PREFETCH;

offset = SignExtend(imm19:'00', 64);
```

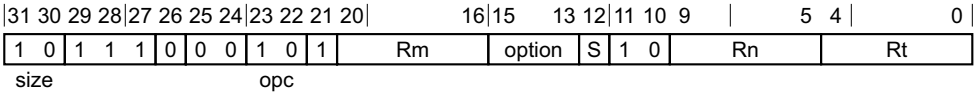
## Assembler symbols

<Xt> Is the 64-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.

<label> Is the program label from which the data is to be loaded. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4.

## Operation

```
bits(64) address = PC[] + offset;
bits(size*8) data;



case memop of
    when MemOp_LOAD
        data = Mem[address, size, AccType_NORMAL];
        if signed then
            X[t] = SignExtend(data, 64);
        else
            X[t] = data;

    when MemOp_PREFETCH
        Prefetch(address, t<4:0>);
```

## C6.6.96 LDRSW (register)

Load Register Signed Word (register) calculates an address from a base register value and an offset register value, loads a word from memory, sign-extends it to form a 64-bit value, and writes it to a register. The offset register value can be shifted left by 0 or 2 bits. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *64-bit variant*

```
LDRSW <Xt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

### Assembler symbols

`<Xt>` Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

`<Wm>` When `option<0>` is set to `0`, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

`<Xm>` When `option<0>` is set to `1`, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

`<extend>` Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:

- `UXTW` when `option = 010`
- `LSL` when `option = 011`
- `SXTW` when `option = 110`
- `SXTX` when `option = 111`

`<amount>` Is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

- `#0` when `S = 0`
- `#2` when `S = 1`

### Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);

## C6.6.97 LDTR

Load Register (unprivileged) loads a word or doubleword from an address in memory, zero-extends it, and writes the result to a register. The address used for the load is calculated from a base register and an immediate offset. When executed at EL1, the memory access is restricted as if execution was at EL0. Otherwise, the access permission is for the Exception level at which the instruction is executed. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### *32-bit variant*

Applies when `size = 10`.

```
LDTR <Wt>, [<Xn|SP>{, #<simm>}]
```

### *64-bit variant*

Applies when `size = 11`.

```
LDTR <Xt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

## Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xt>` | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xn\|SP>` | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| `<simm>` | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

## Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

## C6.6.98 LDTRB

Load Register Byte (unprivileged) loads a byte from an address in memory, zero-extends it, and writes the result to a register. The address used for the load is calculated from a base register and an immediate offset. When executed at EL1, the memory access is restricted as if execution was at EL0. Otherwise, the access permission is for the Exception level at which the instruction is executed. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *Unscaled offset variant*

```
LDTRB <Wt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| <simm> | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

### Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_UNPRIV;
MemOp memop;

## C6.6.99 LDTRH

Load Register Halfword (unprivileged) loads a halfword from an address in memory, zero-extends it, and writes the result to a register. The address used for the load is calculated from a base register and an immediate offset. When executed at EL1, the memory access is restricted as if execution was at EL0. Otherwise, the access permission is for the Exception level at which the instruction is executed. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *Unscaled offset variant*

```
LDTRH <Wt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

## Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| <simm> | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

## Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_UNPRIV;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then
    // store or zero-extending load

## C6.6.100 LDTRSB

Load Register Signed Byte (unprivileged) loads a signed byte from an address in memory, zero-extends it, and writes the result to a register. The address used for the load is calculated from a base register and an immediate offset. When executed at EL1, the memory access is restricted as if execution was at EL0. Otherwise, the access permission is for the Exception level at which the instruction is executed. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *32-bit variant*

Applies when `opc = 11`.

```
LDTRSB <Wt>, [<Xn|SP>{, #<simm>}]
```

### *64-bit variant*

Applies when `opc = 10`.

```
LDTRSB <Xt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

## Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xt>` | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xn\|SP>` | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| `<simm>` | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

## Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_UNPRIV;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then
    // store or zero-extending load

## C6.6.101 LDTRSH

Load Register Signed Halfword (unprivileged) loads a signed halfword from an address in memory, zero-extends it, and writes the result to a register. The address used for the load is calculated from a base register and an immediate offset. When executed at EL1, the memory access is restricted as if execution was at EL0. Otherwise, the access permission is for the Exception level at which the instruction is executed. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *32-bit variant*

Applies when `opc = 11`.

```
LDTRSH <Wt>, [<Xn|SP>{, #<simm>}]
```

### *64-bit variant*

Applies when `opc = 10`.

```
LDTRSH <Xt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

## Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xt>` | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xn\|SP>` | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| `<simm>` | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

## C6.6.103 LDUR

Load Register (unscaled) calculates an address from a base register and an immediate offset, loads a 32-bit word or 64-bit doubleword from memory, zero-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *32-bit variant*

Applies when `size = 10`.

```
LDUR <Wt>, [<Xn|SP>{, #<simm>}]
```

### *64-bit variant*

Applies when `size = 11`.

```
LDUR <Xt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

## Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xt>` | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xn\|SP>` | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| `<simm>` | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

## Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then

## C6.6.104 LDURB

Load Register Byte (unscaled) calculates an address from a base register and an immediate offset, loads a byte from memory, zero-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *Unscaled offset variant*

```
LDURB <Wt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| <simm> | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

### Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then
    // store or zero-extending load
    memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;
    regsize = if size == '11' then 64 else 32;
    signed = FALSE;
else
    if size == '11' then
        memop = MemOp_PREFETCH;
        if opc<0> == '1' then UnallocatedEncoding();
    else
        // sign-extending load
        memop = MemOp_LOAD;
        if size == '10' && opc<0> == '1' then UnallocatedEncoding();
        regsize = if opc<0> == '1' then 32 else 64;
        signed = TRUE;

integer datasize = 8 << scale;
```

## C6.6.105 LDURH

Load Register Halfword (unscaled) calculates an address from a base register and an immediate offset, loads a halfword from memory, zero-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *Unscaled offset variant*

```
LDURH <Wt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| <simm> | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

### Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then
    // store or zero-extending load
    memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;

## C6.6.106 LDURSB

Load Register Signed Byte (unscaled) calculates an address from a base register and an immediate offset, loads a signed byte from memory, sign-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *32-bit variant*

Applies when `opc = 11`.

```
LDURSB <Wt>, [<Xn|SP>{, #<simm>}]
```

### *64-bit variant*

Applies when `opc = 10`.

```
LDURSB <Xt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

## Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xt>` | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xn\|SP>` | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| `<simm>` | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

## Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;

## C6.6.107 LDURSH

Load Register Signed Halfword (unscaled) calculates an address from a base register and an immediate offset, loads a signed halfword from memory, sign-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### 32-bit variant

Applies when opc = 11.

```
LDURSH <Wt>, [<Xn|SP>{, #<simm>}]
```

### 64-bit variant

Applies when opc = 10.

```
LDURSH <Xt>, [<Xn|SP>{, #<simm>}]
```

### Decode for all variants of this encoding

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

## Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xt> | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| <simm> | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

## Shared decode for all encodings

```
integer n = UInt(Rn);

## C6.6.108 LDURSW

Load Register Signed Word (unscaled) calculates an address from a base register and an immediate offset, loads a signed word from memory, sign-extends it, and writes it to a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *Unscaled offset variant*

```
LDURSW <Xt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Assembler symbols

| | |
|---|---|
| <Xt> | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| <simm> | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

### Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then
    // store or zero-extending load
    memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;
    regsize = if size == '11' then 64 else 32;
    signed = FALSE;
else
    if size == '11' then
        memop = MemOp_PREFETCH;
        if opc<0> == '1' then UnallocatedEncoding();
    else
        // sign-extending load

## C6.6.109 LDXP

Load Exclusive Pair of Registers derives an address from a base register value, loads two 32-bit words or two 64-bit doublewords from memory, and writes them to two registers. A 32-bit pair requires the address to be doubleword aligned and is single-copy atomic at doubleword granularity. A 64-bit pair requires the address to be quadword aligned and is single-copy atomic for each doubleword at doubleword granularity. The PE marks the physical address being accessed as an exclusive access. This exclusive access mark is checked by Store Exclusive instructions. See *Synchronization and semaphores* on page B2-107. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### 32-bit variant

Applies when `sz = 0`.

```
LDXP <Wt1>, <Wt2>, [<Xn|SP>{,#0}]
```

### 64-bit variant

Applies when `sz = 1`.

```
LDXP <Xt1>, <Xt2>, [<Xn|SP>{,#0}]
```

### Decode for all variants of this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = TRUE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 32 << UInt(sz);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDXP* on page K1-5509.

## Assembler symbols

| | |
|---|---|
| `<Wt1>` | Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Wt2>` | Is the 32-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field. |
| `<Xt1>` | Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xt2>` | Is the 64-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field. |
| `<Xn\|SP>` | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |

## C6.6.110 LDXR

Load Exclusive Register derives an address from a base register value, loads a 32-bit word or a 64-bit doubleword from memory, and writes it to a register. The memory access is atomic. The PE marks the physical address being accessed as an exclusive access. This exclusive access mark is checked by Store Exclusive instructions. See *Synchronization and semaphores* on page B2-107. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### 32-bit variant

Applies when size = 10.

```
LDXR <Wt>, [<Xn|SP>{,#0}]
```

### 64-bit variant

Applies when size = 11.

```
LDXR <Xt>, [<Xn|SP>{,#0}]
```

### Decode for all variants of this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = FALSE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

## Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xt> | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |

## Operation

```

### C6.6.113 LSL (register)

Logical Shift Left (register) shifts a register value left by a variable number of bits, shifting in zeros, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is left-shifted.

This instruction is an alias of the LSLV instruction. This means that:

- The encodings in this description are named to match the encodings of LSLV.
- The description of LSLV gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0`.

`LSL <Wd>, <Wn>, <Wm>`

is equivalent to

`LSLV <Wd>, <Wn>, <Wm>`

and is always the preferred disassembly.

#### *64-bit variant*

Applies when `sf = 1`.

`LSL <Xd>, <Xn>, <Xm>`

is equivalent to

`LSLV <Xd>, <Xn>, <Xm>`

and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field. |

### Operation

The description of LSLV gives the operational pseudocode for this instruction.

## C6.6.114 LSL (immediate)

Logical Shift Left (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

This instruction is an alias of the UBFM instruction. This means that:

- The encodings in this description are named to match the encodings of UBFM.
- The description of UBFM gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0 && N = 0 && imms != 011111`.

`LSL <Wd>, <Wn>, #<shift>`

is equivalent to

`UBFM <Wd>, <Wn>, #(-<shift> MOD 32), #(31-<shift>)`

and is the preferred disassembly when `imms + 1 == immr`.

### *64-bit variant*

Applies when `sf = 1 && N = 1 && imms != 111111`.

`LSL <Xd>, <Xn>, #<shift>`

is equivalent to

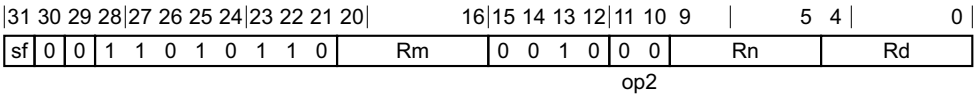
`UBFM <Xd>, <Xn>, #(-<shift> MOD 64), #(63-<shift>)`

and is the preferred disassembly when `imms + 1 == immr`.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<shift>` | For the 32-bit variant: is the shift amount, in the range 0 to 31.<br>For the 64-bit variant: is the shift amount, in the range 0 to 63. |

### Operation



The description of UBFM gives the operational pseudocode for this instruction.

## C6.6.115 LSLV

Logical Shift Left Variable shifts a register value left by a variable number of bits, shifting in zeros, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is left-shifted.

This instruction is used by the alias LSL (register). The alias is always the preferred disassembly.

### 32-bit variant

Applies when `sf = 0`.

```
LSLV <Wd>, <Wn>, <Wm>
```

### 64-bit variant

Applies when `sf = 1`.

```
LSLV <Xd>, <Xn>, <Xm>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
ShiftType shift_type = DecodeShift(op2);
```

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Wm> | Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field. |

## Operation

```
bits(datasize) result;
bits(datasize) operand2 = X[m];

result = ShiftReg(n, shift_type, UInt(operand2) MOD datasize);
X[d] = result;
```

## C6.6.116 LSR (register)

Logical Shift Right (register) shifts a register value right by a variable number of bits, shifting in zeros, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is an alias of the LSRV instruction. This means that:

- The encodings in this description are named to match the encodings of LSRV.
- The description of LSRV gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

`LSR <Wd>, <Wn>, <Wm>`

is equivalent to

`LSRV <Wd>, <Wn>, <Wm>`

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

`LSR <Xd>, <Xn>, <Xm>`

is equivalent to

`LSRV <Xd>, <Xn>, <Xm>`

and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field. |

### Operation

The description of LSRV gives the operational pseudocode for this instruction.

Non-Confidential - Beta

### C6.6.117 LSR (immediate)

Logical Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

This instruction is an alias of the UBFM instruction. This means that:

- The encodings in this description are named to match the encodings of UBFM.
- The description of UBFM gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0 && N = 0 && imms = 011111`.

```
LSR <Wd>, <Wn>, #<shift>
```

is equivalent to

```
UBFM <Wd>, <Wn>, #<shift>, #31
```

and is always the preferred disassembly.

#### *64-bit variant*

Applies when `sf = 1 && N = 1 && imms = 111111`.

```
LSR <Xd>, <Xn>, #<shift>
```

is equivalent to

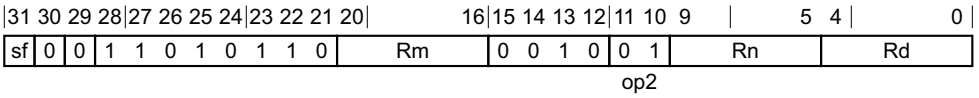
```
UBFM <Xd>, <Xn>, #<shift>, #63
```

and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<shift>` | For the 32-bit variant: is the shift amount, in the range 0 to 31, encoded in the "immr" field.<br>For the 64-bit variant: is the shift amount, in the range 0 to 63, encoded in the "immr" field. |

### Operation



The description of UBFM gives the operational pseudocode for this instruction.

## C6.6.118 LSRV

Logical Shift Right Variable shifts a register value right by a variable number of bits, shifting in zeros, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is used by the alias LSR (register). The alias is always the preferred disassembly.

### 32-bit variant

Applies when `sf = 0`.

```
LSRV <Wd>, <Wn>, <Wm>
```

### 64-bit variant

Applies when `sf = 1`.

```
LSRV <Xd>, <Xn>, <Xm>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
ShiftType shift_type = DecodeShift(op2);
```

## Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.

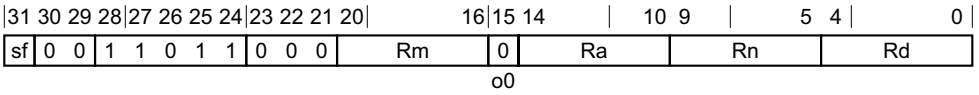
`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

## Operation

```
bits(datasize) result;
bits(datasize) operand2 = X[m];



result = ShiftReg(n, shift_type, UInt(operand2) MOD datasize);
X[d] = result;
```

## C6.6.119 MADD

Multiply-Add multiplies two register values, adds a third register value, and writes the result to the destination register.

This instruction is used by the alias MUL. See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0`.

```
MADD <Wd>, <Wn>, <Wm>, <Wa>
```

### 64-bit variant

Applies when `sf = 1`.

```
MADD <Xd>, <Xn>, <Xm>, <Xa>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
integer destsize = if sf == '1' then 64 else 32;
integer datasize = destsize;
boolean sub_op = (o0 == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| MUL | `Ra == '11111'` |

## Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

`<Wa>` Is the 32-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Xa> Is the 64-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bits(destsize) operand3 = X[a];

integer result;

if sub_op then
    result = UInt(operand3) - (UInt(operand1) * UInt(operand2));
else
    result = UInt(operand3) + (UInt(operand1) * UInt(operand2));

X[d] = result<destsize-1:0>;
```

### C6.6.120 MNEG

Multiply-Negate multiplies two register values, negates the product, and writes the result to the destination register.

This instruction is an alias of the MSUB instruction. This means that:

- The encodings in this description are named to match the encodings of MSUB.
- The description of MSUB gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0`.

```
MNEG <Wd>, <Wn>, <Wm>
```

is equivalent to

```
MSUB <Wd>, <Wn>, <Wm>, WZR
```

and is always the preferred disassembly.

#### *64-bit variant*

Applies when `sf = 1`.

```
MNEG <Xd>, <Xn>, <Xm>
```

is equivalent to

```
MSUB <Xd>, <Xn>, <Xm>, XZR
```

and is always the preferred disassembly.

### Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

### Operation

The description of MSUB gives the operational pseudocode for this instruction.

## C6.6.121 MOV (to/from SP)

Move between register and stack pointer : `Rd = Rn`

This instruction is an alias of the ADD (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of ADD (immediate).
- The description of ADD (immediate) gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

```
MOV <Wd|WSP>, <Wn|WSP>
```

is equivalent to

```
ADD <Wd|WSP>, <Wn|WSP>, #0
```

and is the preferred disassembly when `(Rd == '11111' || Rn == '11111')`.

### *64-bit variant*

Applies when `sf = 1`.

```
MOV <Xd|SP>, <Xn|SP>
```

is equivalent to

```
ADD <Xd|SP>, <Xn|SP>, #0
```

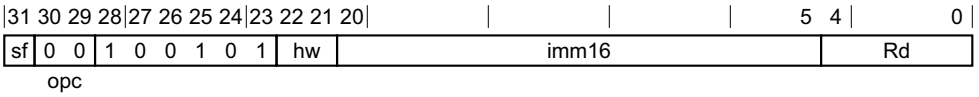
and is the preferred disassembly when `(Rd == '11111' || Rn == '11111')`.

### Assembler symbols

| | |
|---|---|
| `<Wd\|WSP>` | Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field. |
| `<Wn\|WSP>` | Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field. |
| `<Xd\|SP>` | Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field. |
| `<Xn\|SP>` | Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field. |

### Operation

The description of ADD (immediate) gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.122 MOV (inverted wide immediate)

Move (inverted wide immediate) moves an inverted 16-bit immediate value to a register.

This instruction is an alias of the MOVN instruction. This means that:

- The encodings in this description are named to match the encodings of MOVN.
- The description of MOVN gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0`.

```
MOV <Wd>, #<imm>
```

is equivalent to

```
MOVN <Wd>, #<imm16>, LSL #<shift>
```

and is the preferred disassembly when `! (IsZero(imm16) && hw != '00') && ! IsOnes(imm16)`.

#### *64-bit variant*

Applies when `sf = 1`.

```
MOV <Xd>, #<imm>
```

is equivalent to

```
MOVN <Xd>, #<imm16>, LSL #<shift>
```

and is the preferred disassembly when `! (IsZero(imm16) && hw != '00')`.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<imm>` | For the 32-bit variant: is a 32-bit immediate, the bitwise inverse of which can be encoded in "imm16:hw", but excluding 0xffff0000 and 0x0000ffff<br>For the 64-bit variant: is a 64-bit immediate, the bitwise inverse of which can be encoded in "imm16:hw". |
| `<shift>` | For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as <shift>/16.<br>For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as <shift>/16. |

### Operation

The description of MOVN gives the operational pseudocode for this instruction.

Non-Confidential - Beta

## C6.6.123 MOV (wide immediate)

Move (wide immediate) moves a 16-bit immediate value to a register.

This instruction is an alias of the MOVZ instruction. This means that:

- The encodings in this description are named to match the encodings of MOVZ.
- The description of MOVZ gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

```
MOV <Wd>, #<imm>
```

is equivalent to

```
MOVZ <Wd>, #<imm16>, LSL #<shift>
```

and is the preferred disassembly when `! (IsZero(imm16) && hw != '00')`.

### *64-bit variant*

Applies when `sf = 1`.

```
MOV <Xd>, #<imm>
```

is equivalent to

```
MOVZ <Xd>, #<imm16>, LSL #<shift>
```

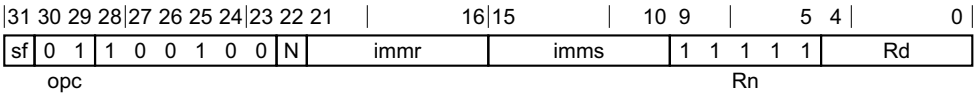
and is the preferred disassembly when `! (IsZero(imm16) && hw != '00')`.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<imm>` | For the 32-bit variant: is a 32-bit immediate which can be encoded in "imm16:hw".<br>For the 64-bit variant: is a 64-bit immediate which can be encoded in "imm16:hw". |
| `<shift>` | For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as <shift>/16.<br>For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as <shift>/16. |

### Operation

The description of MOVZ gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.124 MOV (bitmask immediate)

Move (bitmask immediate) writes a bitmask immediate value to a register.

This instruction is an alias of the ORR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of ORR (immediate).
- The description of ORR (immediate) gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0 && N = 0`.

```
MOV <Wd|WSP>, #<imm>
```

is equivalent to

```
ORR <Wd|WSP>, WZR, #<imm>
```

and is the preferred disassembly when `! MoveWidePreferred(sf, N, imms, immr)`.

#### *64-bit variant*

Applies when `sf = 1`.

```
MOV <Xd|SP>, #<imm>
```

is equivalent to

```
ORR <Xd|SP>, XZR, #<imm>
```

and is the preferred disassembly when `! MoveWidePreferred(sf, N, imms, immr)`.

### Assembler symbols

`<Wd|WSP>` Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

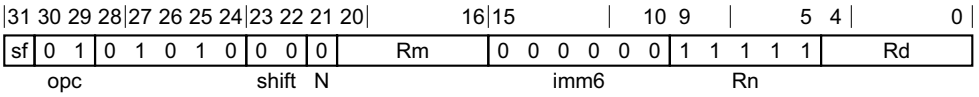
`<Xd|SP>` Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

`<imm>` For the 32-bit variant: is the bitmask immediate, encoded in "imms:immr", but excluding values which could be encoded by MOVZ or MOVN.

For the 64-bit variant: is the bitmask immediate, encoded in "N:imms:immr", but excluding values which could be encoded by MOVZ or MOVN.

### Operation

The description of ORR (immediate) gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.125 MOV (register)

Move (register) copies the value in a source register to the destination register.

This instruction is an alias of the ORR (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of ORR (shifted register).
- The description of ORR (shifted register) gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

```
MOV <Wd>, <Wm>
```

is equivalent to

```
ORR <Wd>, WZR, <Wm>
```

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

```
MOV <Xd>, <Xm>
```

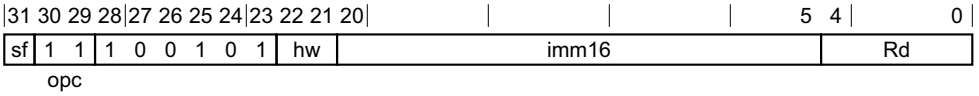
is equivalent to

```
ORR <Xd>, XZR, <Xm>
```

and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wm>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xm>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field. |



### Operation

The description of ORR (shifted register) gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.126 MOVK

Move wide with keep moves an optionally-shifted 16-bit immediate value into a register, keeping other bits unchanged.

### 32-bit variant

Applies when `sf = 0`.

```
MOVK <Wd>, #<imm>{, LSL #<shift>}
```

### 64-bit variant

Applies when `sf = 1`.

```
MOVK <Xd>, #<imm>{, LSL #<shift>}
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer datasize = if sf == '1' then 64 else 32;
bits(16) imm = imm16;
integer pos;
MoveWideOp opcode;

case opc of
    when '00' opcode = MoveWideOp_N;
    when '10' opcode = MoveWideOp_Z;
    when '11' opcode = MoveWideOp_K;
    otherwise UnallocatedEncoding();

if sf == '0' && hw<1> == '1' then UnallocatedEncoding();
pos = UInt(hw:'0000');
```

## Assembler symbols

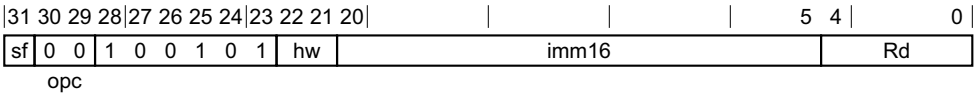
| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <imm> | Is the 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field. |
| <shift> | For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as <shift>/16.<br>For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as <shift>/16. |

## Operation

```
bits(datasize) result;

if opcode == MoveWideOp_K then
    result = X[d];
else
    result = Zeros();
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



```
result<pos+15:pos> = imm;
if opcode == MoveWideOp_N then
    result = NOT(result);
X[d] = result;
```

## C6.6.127 MOVN

Move wide with NOT moves the inverse of an optionally-shifted 16-bit immediate value to a register.

This instruction is used by the alias MOV (inverted wide immediate). See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when sf = 0.

```
MOVN <Wd>, #<imm>{, LSL #<shift>}
```

### 64-bit variant

Applies when sf = 1.

```
MOVN <Xd>, #<imm>{, LSL #<shift>}
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer datasize = if sf == '1' then 64 else 32;
bits(16) imm = imm16;
integer pos;
MoveWideOp opcode;

case opc of
    when '00' opcode = MoveWideOp_N;
    when '10' opcode = MoveWideOp_Z;
    when '11' opcode = MoveWideOp_K;
    otherwise UnallocatedEncoding();

if sf == '0' && hw<1> == '1' then UnallocatedEncoding();
pos = UInt(hw:'0000');
```

## Alias conditions

| Alias | of variant | is preferred when |
|---|---|---|
| MOV (inverted wide immediate) | 64-bit | ! (IsZero(imm16) && hw != '00') |
| MOV (inverted wide immediate) | 32-bit | ! (IsZero(imm16) && hw != '00') && ! IsOnes(imm16) |

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <imm> | Is the 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field. |
| <shift> | For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as <shift>/16. |

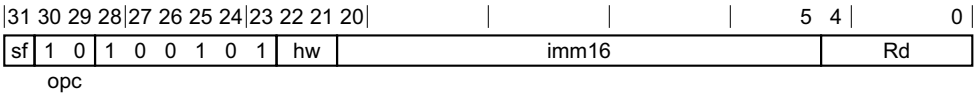
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as <shift>/16.

## Operation

```
bits(datasize) result;

if opcode == MoveWideOp_K then
    result = X[d];
else
    result = Zeros();



result<pos+15:pos> = imm;
if opcode == MoveWideOp_N then
    result = NOT(result);
X[d] = result;
```

## C6.6.128 MOVZ

Move wide with zero moves an optionally-shifted 16-bit immediate value to a register.

This instruction is used by the alias MOV (wide immediate). See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when sf = 0.

```
MOVZ <Wd>, #<imm>{, LSL #<shift>}
```

### 64-bit variant

Applies when sf = 1.

```
MOVZ <Xd>, #<imm>{, LSL #<shift>}
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer datasize = if sf == '1' then 64 else 32;
bits(16) imm = imm16;
integer pos;
MoveWideOp opcode;

case opc of
    when '00' opcode = MoveWideOp_N;
    when '10' opcode = MoveWideOp_Z;
    when '11' opcode = MoveWideOp_K;
    otherwise UnallocatedEncoding();

if sf == '0' && hw<1> == '1' then UnallocatedEncoding();
pos = UInt(hw:'0000');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| MOV (wide immediate) | ! (IsZero(imm16) && hw != '00') |

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <imm> | Is the 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field. |
| <shift> | For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as <shift>/16.<br>For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as <shift>/16. |

## C6.6.129 MRS

Move System Register allows the PE to read an AArch64 System register into a general-purpose register.

### *System variant*

```
MRS <Xt>, <systemreg>
```

### *Decode for this encoding*

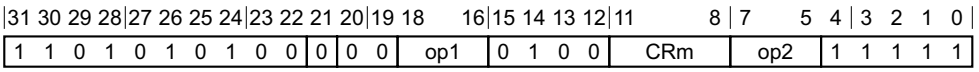
```
CheckSystemAccess('1':o0, op1, CRn, CRm, op2, Rt, L);

integer t = UInt(Rt);

integer sys_op0 = 2 + UInt(o0);
integer sys_op1 = UInt(op1);
integer sys_op2 = UInt(op2);
integer sys_crn = UInt(CRn);
integer sys_crm = UInt(CRm);
boolean read = (L == '1');
```

## Assembler symbols

| | |
|---|---|
| <Xt> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rt" field. |
| <systemreg> | Is a System register name, encoded in the "o0:op1:CRn:CRm:op2". |



## Operation

```
if read then
    X[t] = System_Get(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2);
else
    System_Put(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2, X[t]);
```

## C6.6.130 MSR (immediate)

Move immediate value to Special Register moves an immediate value to selected bits of the PSTATE, namely D, A, I, F, and SP. For more information, see PSTATE.

### *System variant*

```
MSR <pstatefield>, #<imm>
```

### *Decode for this encoding*

```
CheckSystemAccess('00', op1, '0100', CRm, op2, '11111', '0');

bits(4) operand = CRm;
PSTATEField field;
case op1:op2 of
    when '000 101' field = PSTATEField_SP;
    when '011 110' field = PSTATEField_DAIFSet;
    when '011 111' field = PSTATEField_DAIFClr;
    otherwise      UnallocatedEncoding();

// Check that an AArch64 MSR/MRS access to the DAIF flags is permitted
if op1 == '011' && PSTATE.EL == EL0 && SCTLR_EL1.UMA == '0' then
    AArch64.SystemRegisterTrap(EL1, '00', op2, op1, '0100', '11111', CRm, '0');
```

### Assembler symbols

<pstatefield> Is a PSTATE field name, encoded in the "op1:op2" field. It can have the following values:

SPSel when op1 = 000, op2 = 101

DAIFSet when op1 = 011, op2 = 110

DAIFClr when op1 = 011, op2 = 111

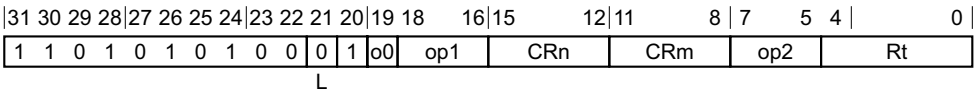
The following encodings are reserved:

- op1 = 000, op2 = 0xx.
- op1 = 000, op2 = 100.
- op1 = 000, op2 = 11x.
- op1 = 001, op2 = xxx.
- op1 = 010, op2 = xxx.
- op1 = 011, op2 = 0xx.
- op1 = 011, op2 = 10x.
- op1 = 1xx, op2 = xxx.

<imm> Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "CRm" field.

### Operation

```
case field of
    when PSTATEField_SP
        PSTATE.SP = operand<0>;
    when PSTATEField_DAIFSet
        PSTATE.D = PSTATE.D OR operand<3>;
```



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
        PSTATE.A = PSTATE.A OR operand<2>;
        PSTATE.I = PSTATE.I OR operand<1>;
        PSTATE.F = PSTATE.F OR operand<0>;
    when PSTATEField_DAIFClr
        PSTATE.D = PSTATE.D AND NOT(operand<3>);
        PSTATE.A = PSTATE.A AND NOT(operand<2>);
        PSTATE.I = PSTATE.I AND NOT(operand<1>);
        PSTATE.F = PSTATE.F AND NOT(operand<0>);
```

## C6.6.131 MSR (register)

Move general-purpose register to System Register allows the PE to write an AArch64 System register from a general-purpose register.

### *System variant*

```
MSR <systemreg>, <Xt>
```

### *Decode for this encoding*

```
CheckSystemAccess('1':o0, op1, CRn, CRm, op2, Rt, L);

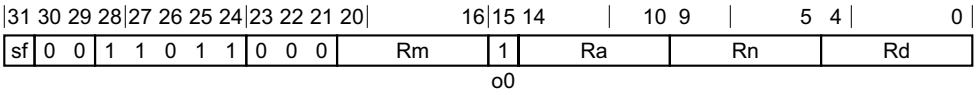
integer t = UInt(Rt);

integer sys_op0 = 2 + UInt(o0);
integer sys_op1 = UInt(op1);
integer sys_op2 = UInt(op2);
integer sys_crn = UInt(CRn);
integer sys_crm = UInt(CRm);
boolean read = (L == '1');
```

### Assembler symbols

| | |
|---|---|
| <systemreg> | Is a System register name, encoded in the "o0:op1:CRn:CRm:op2". |
| <Xt> | Is the 64-bit name of the general-purpose source register, encoded in the "Rt" field. |

### Operation



```
if read then
    X[t] = System_Get(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2);
else
    System_Put(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2, X[t]);
```

## C6.6.132 MSUB

Multiply-Subtract multiplies two register values, subtracts the product from a third register value, and writes the result to the destination register.

This instruction is used by the alias MNEG. See the *Alias conditions* table for details of when each alias is preferred.

### *32-bit variant*

Applies when `sf = 0`.

```
MSUB <Wd>, <Wn>, <Wm>, <Wa>
```

### *64-bit variant*

Applies when `sf = 1`.

```
MSUB <Xd>, <Xn>, <Xm>, <Xa>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
integer destsize = if sf == '1' then 64 else 32;
integer datasize = destsize;
boolean sub_op = (o0 == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| MNEG | `Ra == '11111'` |

## Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

`<Wa>` Is the 32-bit name of the third general-purpose source register holding the minuend, encoded in the "Ra" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Xa> Is the 64-bit name of the third general-purpose source register holding the minuend, encoded in the "Ra" field.

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bits(destsize) operand3 = X[a];

integer result;

if sub_op then
    result = UInt(operand3) - (UInt(operand1) * UInt(operand2));
else
    result = UInt(operand3) + (UInt(operand1) * UInt(operand2));

X[d] = result<destsize-1:0>;
```

## C6.6.133 MUL

Multiply : `Rd = Rn * Rm`

This instruction is an alias of the MADD instruction. This means that:

- The encodings in this description are named to match the encodings of MADD.
- The description of MADD gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

`MUL <Wd>, <Wn>, <Wm>`

is equivalent to

`MADD <Wd>, <Wn>, <Wm>, WZR`

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

`MUL <Xd>, <Xn>, <Xm>`

is equivalent to

`MADD <Xd>, <Xn>, <Xm>, XZR`

and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field. |

### Operation

The description of MADD gives the operational pseudocode for this instruction.

## C6.6.134 MVN

Bitwise NOT writes the bitwise inverse of a register value to the destination register.

This instruction is an alias of the ORN (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of ORN (shifted register).
- The description of ORN (shifted register) gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when `sf = 0`.

```
MVN <Wd>, <Wm>{, <shift> #<amount>}
```

is equivalent to

```
ORN <Wd>, WZR, <Wm>{, <shift> #<amount>}
```

and is always the preferred disassembly.

### 64-bit variant

Applies when `sf = 1`.

```
MVN <Xd>, <Xm>{, <shift> #<amount>}
```

is equivalent to

```
ORN <Xd>, XZR, <Xm>{, <shift> #<amount>}
```

and is always the preferred disassembly.

### Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wm>` Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xm>` Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- `LSL` when `shift = 00`
- `LSR` when `shift = 01`
- `ASR` when `shift = 10`
- `ROR` when `shift = 11`

`<amount>` For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

### C6.6.135 NEG (shifted register)

Negate (shifted register) negates an optionally-shifted register value, and writes the result to the destination register.

This instruction is an alias of the SUB (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of SUB (shifted register).
- The description of SUB (shifted register) gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0`.

```
NEG <Wd>, <Wm>{, <shift> #<amount>}
```

is equivalent to

```
SUB  <Wd>, WZR, <Wm> {, <shift> #<amount>}
```

and is always the preferred disassembly.

#### *64-bit variant*

Applies when `sf = 1`.

```
NEG <Xd>, <Xm>{, <shift> #<amount>}
```

is equivalent to

```
SUB  <Xd>, XZR, <Xm> {, <shift> #<amount>}
```

and is always the preferred disassembly.

### Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wm>` Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xm>` Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- `LSL` when `shift = 00`
- `LSR` when `shift = 01`
- `ASR` when `shift = 10`

The encoding `shift = 11` is reserved.

`<amount>` For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

## C6.6.136 NEGS

Negate, setting flags, negates an optionally-shifted register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is an alias of the SUBS (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of SUBS (shifted register).
- The description of SUBS (shifted register) gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

```
NEGS <Wd>, <Wm>{, <shift> #<amount>}
```

is equivalent to

```
SUBS <Wd>, WZR, <Wm> {, <shift> #<amount>}
```

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

```
NEGS <Xd>, <Xm>{, <shift> #<amount>}
```

is equivalent to

```
SUBS <Xd>, XZR, <Xm> {, <shift> #<amount>}
```

and is always the preferred disassembly.

### Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wm>` Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xm>` Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- `LSL` when `shift = 00`
- `LSR` when `shift = 01`
- `ASR` when `shift = 10`

The encoding `shift = 11` is reserved.

`<amount>` For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

## C6.6.137 NGC

Negate with Carry negates the sum of a register value and the value of NOT (Carry flag), and writes the result to the destination register.

This instruction is an alias of the SBC instruction. This means that:

- The encodings in this description are named to match the encodings of SBC.
- The description of SBC gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

`NGC <Wd>, <Wm>`

is equivalent to

`SBC <Wd>, WZR, <Wm>`

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

`NGC <Xd>, <Xm>`

is equivalent to

`SBC <Xd>, XZR, <Xm>`

and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wm>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xm>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field. |

### Operation

The description of SBC gives the operational pseudocode for this instruction.

Non-Confidential - Beta

### C6.6.138 NGCS

Negate with Carry, setting flags, negates the sum of a register value and the value of NOT (Carry flag), and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is an alias of the SBCS instruction. This means that:

- The encodings in this description are named to match the encodings of SBCS.
- The description of SBCS gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0`.

`NGCS <Wd>, <Wm>`

is equivalent to

`SBCS <Wd>, WZR, <Wm>`

and is always the preferred disassembly.

#### *64-bit variant*

Applies when `sf = 1`.

`NGCS <Xd>, <Xm>`

is equivalent to

`SBCS <Xd>, XZR, <Xm>`

and is always the preferred disassembly.

### Assembler symbols

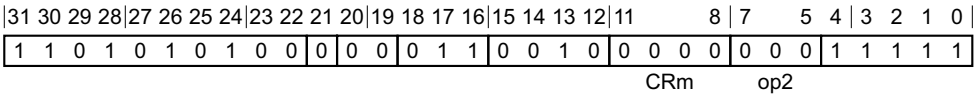
| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wm>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xm>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field. |

### Operation

The description of SBCS gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.139 NOP



No Operation does nothing. This instruction can be used for instruction alignment purposes.

**Note**

The timing effects of including a NOP instruction in a program are not guaranteed. It can increase execution time, leave it unchanged, or even reduce it. Therefore, NOP instructions are not suitable for timing loops.

This instruction is an alias of the HINT instruction. This means that:

- The encodings in this description are named to match the encodings of HINT.
- The description of HINT gives the operational pseudocode for this instruction.

### *System variant*

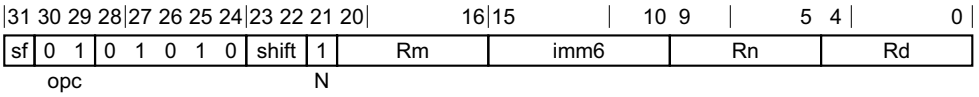
```
NOP
```

is equivalent to

```
HINT #0
```

and is always the preferred disassembly.

### Operation



The description of HINT gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.140 ORN (shifted register)

Bitwise OR NOT (shifted register) performs a bitwise (inclusive) OR of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register.

This instruction is used by the alias MVN. See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0`.

```
ORN <Wd>, <Wn>, <Wm>{, <shift> #<amount>}
```

### 64-bit variant

Applies when `sf = 1`.

```
ORN <Xd>, <Xn>, <Xm>{, <shift> #<amount>}
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean setflags;
LogicalOp op;
case opc of
    when '00' op = LogicalOp_AND; setflags = FALSE;
    when '01' op = LogicalOp_ORR; setflags = FALSE;
    when '10' op = LogicalOp_EOR; setflags = FALSE;
    when '11' op = LogicalOp_AND; setflags = TRUE;

if sf == '0' && imm6<5> == '1' then ReservedValue();

ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
boolean invert = (N == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| MVN | `Rn == '11111'` |

## Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Xm> Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

LSL when shift = 00

LSR when shift = 01

ASR when shift = 10

ROR when shift = 11

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

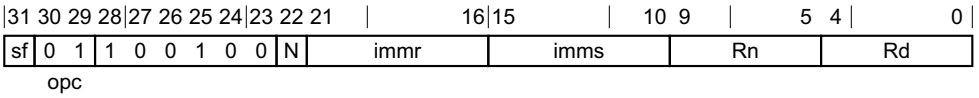
## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);

if invert then operand2 = NOT(operand2);

case op of
    when LogicalOp_AND result = operand1 AND operand2;
    when LogicalOp_ORR result = operand1 OR  operand2;
    when LogicalOp_EOR result = operand1 EOR operand2;

if setflags then
    PSTATE.<N,Z,C,V> = result<datasize-1>:IsZeroBit(result):'00';



X[d] = result;
```

## C6.6.141 ORR (immediate)

Bitwise OR (immediate) performs a bitwise (inclusive) OR of a register value and an immediate register value, and writes the result to the destination register.

This instruction is used by the alias MOV (bitmask immediate). See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0 && N = 0`.

```
ORR <Wd|WSP>, <Wn>, #<imm>
```

### 64-bit variant

Applies when `sf = 1`.

```
ORR <Xd|SP>, <Xn>, #<imm>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
boolean setflags;
LogicalOp op;
case opc of
    when '00' op = LogicalOp_AND; setflags = FALSE;
    when '01' op = LogicalOp_ORR; setflags = FALSE;
    when '10' op = LogicalOp_EOR; setflags = FALSE;
    when '11' op = LogicalOp_AND; setflags = TRUE;

bits(datasize) imm;
if sf == '0' && N != '0' then ReservedValue();
(imm, -) = DecodeBitMasks(N, imms, immr, TRUE);
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| MOV (bitmask immediate) | `Rn == '11111' && ! MoveWidePreferred(sf, N, imms, immr)` |

## Assembler symbols

| | |
|---|---|
| `<Wd\|WSP>` | Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xd\|SP>` | Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<imm> For the 32-bit variant: is the bitmask immediate, encoded in "imms:immr".

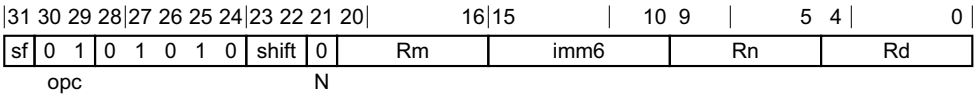
For the 64-bit variant: is the bitmask immediate, encoded in "N:imms:immr".

## Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = imm;

case op of
    when LogicalOp_AND result = operand1 AND operand2;
    when LogicalOp_ORR result = operand1 OR  operand2;
    when LogicalOp_EOR result = operand1 EOR operand2;

if setflags then
    PSTATE.<N,Z,C,V> = result<datasize-1>:IsZeroBit(result):'00';



if d == 31 && !setflags then
    SP[] = result;
else
    X[d] = result;
```

## C6.6.142 ORR (shifted register)

Bitwise OR (shifted register) performs a bitwise (inclusive) OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

This instruction is used by the alias MOV (register). See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0`.

```
ORR <Wd>, <Wn>, <Wm>{, <shift> #<amount>}
```

### 64-bit variant

Applies when `sf = 1`.

```
ORR <Xd>, <Xn>, <Xm>{, <shift> #<amount>}
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean setflags;
LogicalOp op;
case opc of
    when '00' op = LogicalOp_AND; setflags = FALSE;
    when '01' op = LogicalOp_ORR; setflags = FALSE;
    when '10' op = LogicalOp_EOR; setflags = FALSE;
    when '11' op = LogicalOp_AND; setflags = TRUE;

if sf == '0' && imm6<5> == '1' then ReservedValue();

ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
boolean invert = (N == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| MOV (register) | `shift == '00' && imm6 == '000000' && Rn == '11111'` |

## Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

### C6.6.143 PRFM (immediate)

Prefetch Memory (immediate) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFM instruction is IMPLEMENTATION DEFINED. For more information, see *Prefetch memory* on page C3-151.

For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

#### *Unsigned offset variant*

```
PRFM (<prfop>|#<imm5>), [<Xn|SP>{, #<pimm>}]
```

#### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = LSL(ZeroExtend(imm12, 64), scale);
```

### Assembler symbols

<prfop> Is the prefetch operation, defined as <type><target><policy>. <type> is one of:

PLD Prefetch for load, encoded in the "Rt<4:3>" field as 0b00.

PLI Preload instructions, encoded in the "Rt<4:3>" field as 0b01.

PST Prefetch for store, encoded in the "Rt<4:3>" field as 0b10.

<target> is one of:

L1 Level 1 cache, encoded in the "Rt<2:1>" field as 0b00.

L2 Level 2 cache, encoded in the "Rt<2:1>" field as 0b01.

L3 Level 3 cache, encoded in the "Rt<2:1>" field as 0b10.

<policy> is one of:

KEEP Retained or temporal prefetch, allocated in the cache normally. Encoded in the "Rt<0>" field as 0.

STRM Streaming or non-temporal prefetch, for data that is used only once. Encoded in the "Rt<0>" field as 1.

For more information on these prefetch operations, see *Prefetch memory* on page C3-151. For other encodings of the "Rt" field, use <imm5>.

<imm5> Is the prefetch operation encoding as an immediate, in the range 0 to 31, encoded in the "Rt" field. This syntax is only for encodings that are not accessible using <prfop>.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<pimm> Is the optional positive immediate byte offset, a multiple of 8 in the range 0 to 32760, defaulting to 0 and encoded in the "imm12" field as <pimm>/8.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then
    // store or zero-extending load
    memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;
    regsize = if size == '11' then 64 else 32;
    signed = FALSE;
else
    if size == '11' then
        memop = MemOp_PREFETCH;
        if opc<0> == '1' then UnallocatedEncoding();
    else
        // sign-extending load
        memop = MemOp_LOAD;
        if size == '10' && opc<0> == '1' then UnallocatedEncoding();
        regsize = if opc<0> == '1' then 32 else 64;
        signed = TRUE;

integer datasize = 8 << scale;
```

### Operation

```
bits(64) address;
bits(datasize) data;
boolean wb_unknown = FALSE;
boolean rt_unknown = FALSE;

if memop == MemOp_LOAD && wback && n == t && n != 31 then

## C6.6.144 PRFM (literal)

Prefetch Memory (literal) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFM instruction is IMPLEMENTATION DEFINED. For more information, see *Prefetch memory* on page C3-151.

For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *Literal variant*

```
PRFM (<prfop>|#<imm5>), <label>
```

### *Decode for this encoding*

```
integer t = UInt(Rt);
MemOp memop = MemOp_LOAD;
boolean signed = FALSE;
integer size;
bits(64) offset;

case opc of
    when '00'
        size = 4;
    when '01'
        size = 8;
    when '10'
        size = 4;
        signed = TRUE;
    when '11'
        memop = MemOp_PREFETCH;

offset = SignExtend(imm19:'00', 64);
```

### Assembler symbols

<prfop> Is the prefetch operation, defined as <type><target><policy>. <type> is one of:

- PLD — Prefetch for load, encoded in the "Rt<4:3>" field as 0b00.
- PLI — Preload instructions, encoded in the "Rt<4:3>" field as 0b01.
- PST — Prefetch for store, encoded in the "Rt<4:3>" field as 0b10.

<target> is one of:

- L1 — Level 1 cache, encoded in the "Rt<2:1>" field as 0b00.
- L2 — Level 2 cache, encoded in the "Rt<2:1>" field as 0b01.
- L3 — Level 3 cache, encoded in the "Rt<2:1>" field as 0b10.

<policy> is one of:

- KEEP — Retained or temporal prefetch, allocated in the cache normally. Encoded in the "Rt<0>" field as 0.
- STRM — Streaming or non-temporal prefetch, for data that is used only once. Encoded in the "Rt<0>" field as 1.

Non-Confidential - Beta

For more information on these prefetch operations, see *Prefetch memory* on page C3-151. For other encodings of the "Rt" field, use <imm5>.

<imm5> Is the prefetch operation encoding as an immediate, in the range 0 to 31, encoded in the "Rt" field. This syntax is only for encodings that are not accessible using <prfop>.

<label> Is the program label from which the data is to be loaded. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4.

## Operation

```
bits(64) address = PC[] + offset;
bits(size*8) data;

case memop of
    when MemOp_LOAD
        data = Mem[address, size, AccType_NORMAL];
        if signed then
            X[t] = SignExtend(data, 64);
        else
            X[t] = data;

    when MemOp_PREFETCH
        Prefetch(address, t<4:0>);
```

## C6.6.145 PRFM (register)

Prefetch Memory (register) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFM instruction is IMPLEMENTATION DEFINED. For more information, see *Prefetch memory* on page C3-151.

For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *Integer variant*

```
PRFM (<prfop>|#<imm5>), [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

### Assembler symbols

<prfop> Is the prefetch operation, defined as <type><target><policy>. <type> is one of:

- PLD — Prefetch for load, encoded in the "Rt<4:3>" field as 0b00.
- PLI — Preload instructions, encoded in the "Rt<4:3>" field as 0b01.
- PST — Prefetch for store, encoded in the "Rt<4:3>" field as 0b10.

<target> is one of:

- L1 — Level 1 cache, encoded in the "Rt<2:1>" field as 0b00.
- L2 — Level 2 cache, encoded in the "Rt<2:1>" field as 0b01.
- L3 — Level 3 cache, encoded in the "Rt<2:1>" field as 0b10.

<policy> is one of:

- KEEP — Retained or temporal prefetch, allocated in the cache normally. Encoded in the "Rt<0>" field as 0.
- STRM — Streaming or non-temporal prefetch, for data that is used only once. Encoded in the "Rt<0>" field as 1.

For more information on these prefetch operations, see *Prefetch memory* on page C3-151. For other encodings of the "Rt" field, use <imm5>.

<imm5> Is the prefetch operation encoding as an immediate, in the range 0 to 31, encoded in the "Rt" field. This syntax is only for encodings that are not accessible using <prfop>.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Wm> When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Xm> When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

<extend> Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:

UXTW when option = 010

LSL when option = 011

SXTW when option = 110

SXTX when option = 111

<amount> Is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

#0 when S = 0

#3 when S = 1

## Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then
    // store or zero-extending load
    memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;
    regsize = if size == '11' then 64 else 32;
    signed = FALSE;
else
    if size == '11' then
        memop = MemOp_PREFETCH;
        if opc<0> == '1' then UnallocatedEncoding();
    else
        // sign-extending load
        memop = MemOp_LOAD;
        if size == '10' && opc<0> == '1' then UnallocatedEncoding();
        regsize = if opc<0> == '1' then 32 else 64;
        signed = TRUE;

integer datasize = 8 << scale;
```

## Operation

```
bits(64) offset = ExtendReg(m, extend_type, shift);
bits(64) address;
bits(datasize) data;
boolean wb_unknown = FALSE;
boolean rt_unknown = FALSE;

### C6.6.146 PRFM (unscaled offset)

Prefetch Memory (unscaled offset) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFUM instruction is IMPLEMENTATION DEFINED. For more information, see *Prefetch memory* on page C3-151.

For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

#### *Unscaled offset variant*

```
PRFUM (<prfop>|#<imm5>), [<Xn|SP>{, #<simm>}]
```

#### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Assembler symbols

<prfop> Is the prefetch operation, defined as <type><target><policy>. <type> is one of:

PLD Prefetch for load, encoded in the "Rt<4:3>" field as 0b00.

PLI Preload instructions, encoded in the "Rt<4:3>" field as 0b01.

PST Prefetch for store, encoded in the "Rt<4:3>" field as 0b10.

<target> is one of:

L1 Level 1 cache, encoded in the "Rt<2:1>" field as 0b00.

L2 Level 2 cache, encoded in the "Rt<2:1>" field as 0b01.

L3 Level 3 cache, encoded in the "Rt<2:1>" field as 0b10.

<policy> is one of:

KEEP Retained or temporal prefetch, allocated in the cache normally. Encoded in the "Rt<0>" field as 0.

STRM Streaming or non-temporal prefetch, for data that is used only once. Encoded in the "Rt<0>" field as 1.

For more information on these prefetch operations, see *Prefetch memory* on page C3-151. For other encodings of the "Rt" field, use <imm5>.

<imm5> Is the prefetch operation encoding as an immediate, in the range 0 to 31, encoded in the "Rt" field. This syntax is only for encodings that are not accessible using <prfop>.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<simm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Non-Confidential - Beta

### Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then
    // store or zero-extending load
    memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;
    regsize = if size == '11' then 64 else 32;
    signed = FALSE;
else
    if size == '11' then
        memop = MemOp_PREFETCH;
        if opc<0> == '1' then UnallocatedEncoding();
    else
        // sign-extending load
        memop = MemOp_LOAD;
        if size == '10' && opc<0> == '1' then UnallocatedEncoding();
        regsize = if opc<0> == '1' then 32 else 64;
        signed = TRUE;

integer datasize = 8 << scale;
```

### Operation

```
bits(64) address;
bits(datasize) data;
boolean wb_unknown = FALSE;
boolean rt_unknown = FALSE;

if memop == MemOp_LOAD && wback && n == t && n != 31 then

## C6.6.147 RBIT

Reverse Bits reverses the bit order in a register.

### *32-bit variant*

Applies when `sf = 0`.

```
RBIT <Wd>, <Wn>
```

### *64-bit variant*

Applies when `sf = 1`.

```
RBIT <Xd>, <Xn>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer datasize = if sf == '1' then 64 else 32;

boolean is_rbit = opc == '00';
integer container_size;
case opc of
    when '01'
        container_size = 16;
    when '10'
        container_size = 32;
    when '11'
        if sf == '0' then UnallocatedEncoding();
        container_size = 64;
```

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |

## Operation

```
bits(datasize) operand = X[n];
bits(datasize) result;

if is_rbit then
    for i = 0 to datasize-1
        result<datasize-1-i> = operand<i>;
else
    integer containers = datasize DIV container_size;
    integer elements_per_container = container_size DIV 8;
    integer index = 0;
    integer rev_index;
```

## C6.6.148 RET

Return from subroutine branches unconditionally to an address in a register, with a hint that this is a subroutine return.

### *Integer variant*

```
RET {<Xn>}
```

### *Decode for this encoding*

```
integer n = UInt(Rn);
BranchType branch_type;

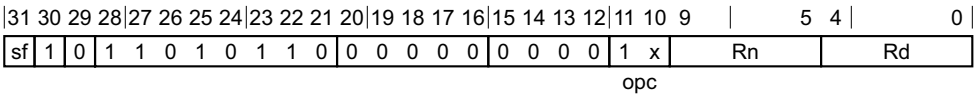
case op of
    when '00' branch_type = BranchType_JMP;
    when '01' branch_type = BranchType_CALL;
    when '10' branch_type = BranchType_RET;
    otherwise UnallocatedEncoding();
```

## Assembler symbols

<Xn> Is the 64-bit name of the general-purpose register holding the address to be branched to, encoded in the "Rn" field. Defaults to X30 if absent.

## Operation

```
bits(64) target = X[n];



if branch_type == BranchType_CALL then X[30] = PC[] + 4;
BranchTo(target, branch_type);
```

## C6.6.149 REV

Reverse Bytes reverses the byte order in a register.

This instruction is used by the pseudo-instruction REV64.

### 32-bit variant

Applies when `sf = 0 && opc = 10`.

```
REV <Wd>, <Wn>
```

### 64-bit variant

Applies when `sf = 1 && opc = 11`.

```
REV <Xd>, <Xn>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer datasize = if sf == '1' then 64 else 32;

boolean is_rbit = opc == '00';
integer container_size;
case opc of
    when '01'
        container_size = 16;
    when '10'
        container_size = 32;
    when '11'
        if sf == '0' then UnallocatedEncoding();
        container_size = 64;
```

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |

## Operation

```
bits(datasize) operand = X[n];
bits(datasize) result;

if is_rbit then
    for i = 0 to datasize-1
        result<datasize-1-i> = operand<i>;

## C6.6.150 REV16

Reverse bytes in 16-bit halfwords reverses the byte order in each 16-bit halfword of a register.

### 32-bit variant

Applies when `sf = 0`.

```
REV16 <Wd>, <Wn>
```

### 64-bit variant

Applies when `sf = 1`.

```
REV16 <Xd>, <Xn>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer datasize = if sf == '1' then 64 else 32;

boolean is_rbit = opc == '00';
integer container_size;
case opc of
    when '01'
        container_size = 16;
    when '10'
        container_size = 32;
    when '11'
        if sf == '0' then UnallocatedEncoding();
        container_size = 64;
```

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |

## C6.6.151 REV32

Reverse bytes in 32-bit words reverses the byte order in each 32-bit word of a register.

### 64-bit variant

```
REV32 <Xd>, <Xn>
```

### Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer datasize = if sf == '1' then 64 else 32;

boolean is_rbit = opc == '00';
integer container_size;
case opc of
    when '01'
        container_size = 16;
    when '10'
        container_size = 32;
    when '11'
        if sf == '0' then UnallocatedEncoding();
        container_size = 64;
```

## Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

## Operation

```
bits(datasize) operand = X[n];
bits(datasize) result;

if is_rbit then
    for i = 0 to datasize-1
        result<datasize-1-i> = operand<i>;
else
    integer containers = datasize DIV container_size;
    integer elements_per_container = container_size DIV 8;
    integer index = 0;
    integer rev_index;
    for c = 0 to containers-1
        rev_index = index + ((elements_per_container - 1) * 8);
        for e = 0 to elements_per_container-1
            result<rev_index + 7:rev_index> = operand<index + 7:index>;
            index = index + 8;
            rev_index = rev_index - 8;

X[d] = result;
```

## C6.6.152 REV64

Reverse Bytes reverses the byte order in a 64-bit general-purpose register.

It is OPTIONAL whether an assembler supports this pseudo-instruction.

This instruction is an alias of the REV instruction. This means that:

- The encodings in this description are named to match the encodings of REV.
- The description of REV gives the operational pseudocode for this instruction.

### *64-bit variant*

```
REV64 <Xd>, <Xn>
```

is equivalent to

```
REV   <Xd>, <Xn>
```

and is never the preferred disassembly.

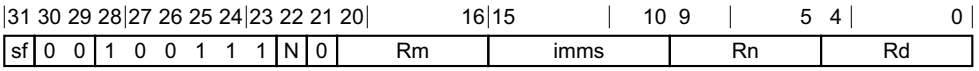
### Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

### Operation

The description of REV gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.153 ROR (immediate)

Rotate right (immediate) provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

This instruction is an alias of the EXTR instruction. This means that:

- The encodings in this description are named to match the encodings of EXTR.
- The description of EXTR gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0 && N = 0 && imms = 0xxxxx`.

`ROR <Wd>, <Ws>, #<shift>`

is equivalent to

`EXTR <Wd>, <Ws>, <Ws>, #<shift>`

and is the preferred disassembly when `Rn == Rm`.

#### *64-bit variant*

Applies when `sf = 1 && N = 1`.

`ROR <Xd>, <Xs>, #<shift>`

is equivalent to

`EXTR <Xd>, <Xs>, <Xs>, #<shift>`

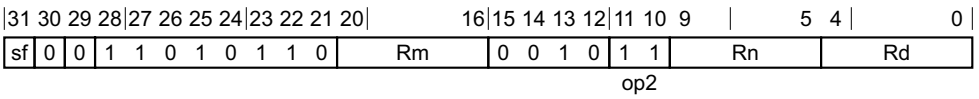
and is the preferred disassembly when `Rn == Rm`.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Ws>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xs>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields. |
| `<shift>` | For the 32-bit variant: is the amount by which to rotate, in the range 0 to 31, encoded in the "imms" field.<br>For the 64-bit variant: is the amount by which to rotate, in the range 0 to 63, encoded in the "imms" field. |

### Operation

The description of EXTR gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.154 ROR (register)

Rotate Right (register) provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is an alias of the RORV instruction. This means that:

- The encodings in this description are named to match the encodings of RORV.
- The description of RORV gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0`.

`ROR <Wd>, <Wn>, <Wm>`

is equivalent to

`RORV <Wd>, <Wn>, <Wm>`

and is always the preferred disassembly.

#### *64-bit variant*

Applies when `sf = 1`.

`ROR <Xd>, <Xn>, <Xm>`

is equivalent to

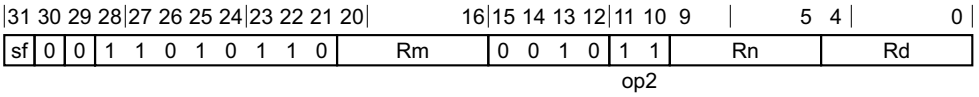
`RORV <Xd>, <Xn>, <Xm>`

and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field. |

### Operation



The description of RORV gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.155 RORV

Rotate Right Variable provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is used by the alias ROR (register). The alias is always the preferred disassembly.

### 32-bit variant

Applies when `sf = 0`.

```
RORV <Wd>, <Wn>, <Wm>
```

### 64-bit variant

Applies when `sf = 1`.

```
RORV <Xd>, <Xn>, <Xm>
```

### Decode for all variants of this encoding

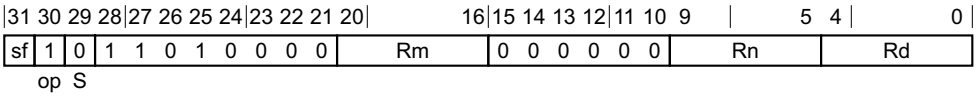
```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
ShiftType shift_type = DecodeShift(op2);
```

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Wm> | Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field. |

## Operation

```
bits(datasize) result;
bits(datasize) operand2 = X[m];



result = ShiftReg(n, shift_type, UInt(operand2) MOD datasize);
X[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.156 SBC

Subtract with Carry subtracts a register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

This instruction is used by the alias NGC. See the *Alias conditions* table for details of when each alias is preferred.

### *32-bit variant*

Applies when `sf = 0`.

```
SBC <Wd>, <Wn>, <Wm>
```

### *64-bit variant*

Applies when `sf = 1`.

```
SBC <Xd>, <Xn>, <Xm>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| NGC | `Rn == '11111'` |

## Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |

## Operation

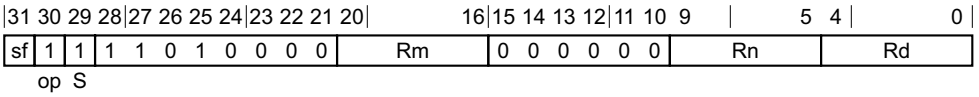
```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bits(4) nzcv;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
if sub_op then
    operand2 = NOT(operand2);

(result, nzcv) = AddWithCarry(operand1, operand2, PSTATE.C);

if setflags then
    PSTATE.<N,Z,C,V> = nzcv;



X[d] = result;
```

Non-Confidential - Beta

## C6.6.157 SBCS

Subtract with Carry, setting flags, subtracts a register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias NGCS. See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0`.

```
SBCS <Wd>, <Wn>, <Wm>
```

### 64-bit variant

Applies when `sf = 1`.

```
SBCS <Xd>, <Xn>, <Xm>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| NGCS | `Rn == '11111'` |

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Wm> | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |

## Operation

```
bits(datasize) result;

## C6.6.158 SBFIZ

Signed Bitfield Insert in Zero zeroes the destination register and copies any number of contiguous bits from a source register into any position in the destination register, sign-extending the most significant bit of the transferred value.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0 && N = 0`.

`SBFIZ <Wd>, <Wn>, #<lsb>, #<width>`

is equivalent to

`SBFM <Wd>, <Wn>, #(-<lsb> MOD 32), #(<width>-1)`

and is the preferred disassembly when `UInt(imms) < UInt(immr)`.

### *64-bit variant*

Applies when `sf = 1 && N = 1`.

`SBFIZ <Xd>, <Xn>, #<lsb>, #<width>`

is equivalent to

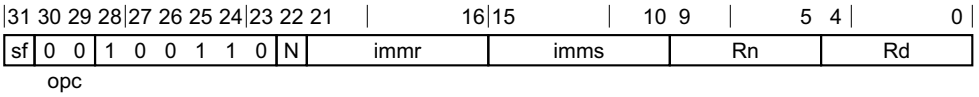
`SBFM <Xd>, <Xn>, #(-<lsb> MOD 64), #(<width>-1)`

and is the preferred disassembly when `UInt(imms) < UInt(immr)`.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<lsb>` | For the 32-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 31.<br>For the 64-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 63. |
| `<width>` | For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<lsb>.<br>For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<lsb>. |

### Operation



The description of SBFM gives the operational pseudocode for this instruction.

Non-Confidential - Beta

## C6.6.159 SBFM

Signed Bitfield Move copies any number of low-order bits from a source register into the same number of adjacent bits at any position in the destination register, shifting in copies of the sign bit in the upper bits and zeros in the lower bits.

This instruction is used by the aliases ASR (immediate), SBFIZ, SBFX, SXTB, SXTH, and SXTW. See the *Alias conditions* on page C6-711 table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0 && N = 0`.

```
SBFM <Wd>, <Wn>, #<immr>, #<imms>
```

### 64-bit variant

Applies when `sf = 1 && N = 1`.

```
SBFM <Xd>, <Xn>, #<immr>, #<imms>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;

boolean inzero;
boolean extend;
integer R;
integer S;
bits(datasize) wmask;
bits(datasize) tmask;

case opc of
    when '00' inzero = TRUE;  extend = TRUE;    // SBFM
    when '01' inzero = FALSE; extend = FALSE;   // BFM
    when '10' inzero = TRUE;  extend = FALSE;   // UBFM
    when '11' UnallocatedEncoding();

if sf == '1' && N != '1' then ReservedValue();
if sf == '0' && (N != '0' || immr<5> != '0' || imms<5> != '0') then ReservedValue();

R = UInt(immr);
S = UInt(imms);
(wmask, tmask) = DecodeBitMasks(N, imms, immr, FALSE);
```

Non-Confidential - Beta

### Alias conditions

| Alias | of variant | is preferred when |
|---|---|---|
| ASR (immediate) | 32-bit | `imms == '011111'` |
| ASR (immediate) | 64-bit | `imms == '111111'` |
| SBFIZ | - | `UInt(imms) < UInt(immr)` |
| SBFX | - | `BFXPreferred(sf, opc<1>, imms, immr)` |
| SXTB | - | `immr == '000000' && imms == '000111'` |
| SXTH | - | `immr == '000000' && imms == '001111'` |
| SXTW | - | `immr == '000000' && imms == '011111'` |

### Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

`<immr>` For the 32-bit variant: is the right rotate amount, in the range 0 to 31, encoded in the "immr" field.

For the 64-bit variant: is the right rotate amount, in the range 0 to 63, encoded in the "immr" field.

`<imms>` For the 32-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 31, encoded in the "imms" field.

For the 64-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 63, encoded in the "imms" field.

### Operation

```
bits(datasize) dst = if inzero then Zeros() else X[d];
bits(datasize) src = X[n];

// perform bitfield move on low bits
bits(datasize) bot = (dst AND NOT(wmask)) OR (ROR(src, R) AND wmask);

// determine extension bits (sign, zero or dest register)
bits(datasize) top = if extend then Replicate(src<S>) else dst;

// combine extension bits and result bits
X[d] = (top AND NOT(tmask)) OR (bot AND tmask);
```

## C6.6.160 SBFX

Signed Bitfield Extract extracts any number of adjacent bits at any position from a register, sign-extends them to the size of the register, and writes the result to the destination register.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0 && N = 0`.

`SBFX <Wd>, <Wn>, #<lsb>, #<width>`

is equivalent to

`SBFM <Wd>, <Wn>, #<lsb>, #(<lsb>+<width>-1)`

and is the preferred disassembly when `BFXPreferred(sf, opc<1>, imms, immr)`.

### *64-bit variant*

Applies when `sf = 1 && N = 1`.

`SBFX <Xd>, <Xn>, #<lsb>, #<width>`

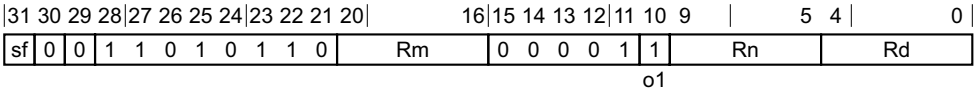
is equivalent to

`SBFM <Xd>, <Xn>, #<lsb>, #(<lsb>+<width>-1)`

and is the preferred disassembly when `BFXPreferred(sf, opc<1>, imms, immr)`.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<lsb>` | For the 32-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 31.<br>For the 64-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 63. |
| `<width>` | For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<lsb>.<br>For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<lsb>. |



### Operation

The description of SBFM gives the operational pseudocode for this instruction.

Non-Confidential - Beta

## C6.6.161 SDIV

Signed Divide divides a signed integer register value by another signed integer register value, and writes the result to the destination register. The condition flags are not affected.

### 32-bit variant

Applies when `sf = 0`.

```
SDIV <Wd>, <Wn>, <Wm>
```

### 64-bit variant

Applies when `sf = 1`.

```
SDIV <Xd>, <Xn>, <Xm>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean unsigned = (o1 == '0');
```

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Wm> | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
integer result;

if IsZero(operand2) then
    result = 0;
else
    result = RoundTowardsZero(Real(Int(operand1, unsigned)) / Real(Int(operand2, unsigned)));

X[d] = result<datasize-1:0>;
```

### C6.6.162 SEV

Send Event is a hint instruction. It causes an event to be signaled to all PEs in the multiprocessor system. For more information, see *Wait for Event mechanism and Send event* on page D1-1611.

This instruction is an alias of the HINT instruction. This means that:

- The encodings in this description are named to match the encodings of HINT.
- The description of HINT gives the operational pseudocode for this instruction.

#### *System variant*

```
SEV
```

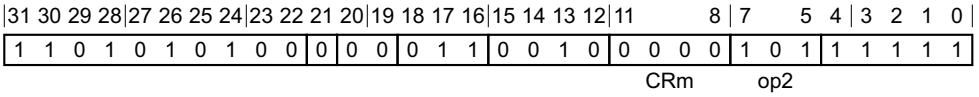
is equivalent to

```
HINT #4
```

and is always the preferred disassembly.

### Operation

The description of HINT gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.163 SEVL

Send Event Local is a hint instruction. It causes an event to be signaled locally without the requirement to affect other PEs in the multiprocessor system. It can prime a wait-loop which starts with a `WFE` instruction.

This instruction is an alias of the HINT instruction. This means that:

- The encodings in this description are named to match the encodings of HINT.
- The description of HINT gives the operational pseudocode for this instruction.

#### *System variant*

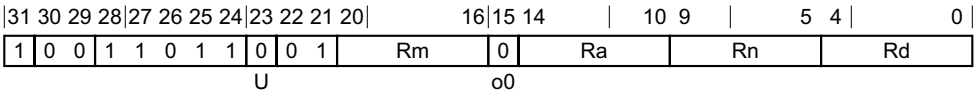
`SEVL`

is equivalent to

`HINT #5`

and is always the preferred disassembly.

### Operation



The description of HINT gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.164 SMADDL

Signed Multiply-Add Long multiplies two 32-bit register values, adds a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias SMULL. See the *Alias conditions* table for details of when each alias is preferred.

### 64-bit variant

```
SMADDL <Xd>, <Wn>, <Wm>, <Xa>
```

### Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
integer destsize = 64;
integer datasize = 32;
boolean sub_op = (o0 == '1');
boolean unsigned = (U == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| SMULL | `Ra == '11111'` |

## Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Xa> Is the 64-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bits(destsize) operand3 = X[a];

integer result;

if sub_op then
    result = Int(operand3, unsigned) - (Int(operand1, unsigned) * Int(operand2, unsigned));
else
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
    result = Int(operand3, unsigned) + (Int(operand1, unsigned) * Int(operand2, unsigned));

X[d] = result<63:0>;
```

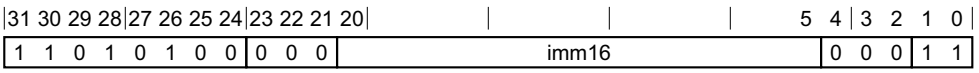
## C6.6.165 SMC

Secure Monitor Call causes an exception to EL3.



SMC is available only for software executing at EL1 or higher. It is UNDEFINED in EL0.

If the values of HCR_EL2.TSC and SCR_EL3.SMD are both 0, execution of an SMC instruction at EL1 or higher generates a Secure Monitor Call exception, using the EC value 0x17, that is taken to EL3. When EL3 is using AArch32, this exception is taken to Monitor mode.

If the value of HCR_EL2.TSC is 1, execution of an SMC instruction in a Non-secure EL1 state generates an exception that is taken to EL2, regardless of the value of SCR_EL3.SMD. When EL2 is using AArch32, this is a Hyp Trap exception that is taken to Hyp mode. For more information, see *Traps to EL2 of Non-secure EL1 execution of SMC instructions* on page D1-1590.

If the value of HCR_EL2.TSC is 0 and the value of SCR_EL3.SMD is 1, the SMC instruction is:

- UNDEFINED in Non-secure state.
- CONSTRAINED UNPREDICTABLE if executed in Secure state at EL1 or higher.

### *System variant*

```
SMC #<imm>
```

### *Decode for this encoding*

```
bits(16) imm = imm16;
```

## Assembler symbols

<imm> Is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.

## Operation

```
if !HaveEL(EL3) || PSTATE.EL == EL0 then
    UnallocatedEncoding();

AArch64.CheckForSMCTrap(imm);

if SCR_EL3.SMD == '1' then
    // SMC disabled
    AArch64.UndefinedFault();
else
    AArch64.CallSecureMonitor(imm);
```

## C6.6.166 SMNEGL

Signed Multiply-Negate Long multiplies two 32-bit register values, negates the product, and writes the result to the 64-bit destination register.

This instruction is an alias of the SMSUBL instruction. This means that:

- The encodings in this description are named to match the encodings of SMSUBL.
- The description of SMSUBL gives the operational pseudocode for this instruction.

### *64-bit variant*

```
SMNEGL <Xd>, <Wn>, <Wm>
```

is equivalent to

```
SMSUBL <Xd>, <Wn>, <Wm>, XZR
```

and is always the preferred disassembly.

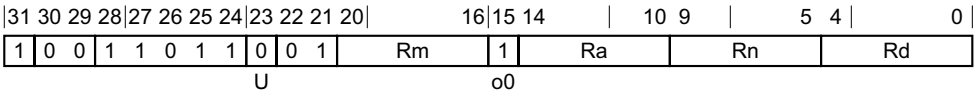
### Assembler symbols

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

### Operation



The description of SMSUBL gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.167 SMSUBL

Signed Multiply-Subtract Long multiplies two 32-bit register values, subtracts the product from a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias SMNEGL. See the *Alias conditions* table for details of when each alias is preferred.

### 64-bit variant

```
SMSUBL <Xd>, <Wn>, <Wm>, <Xa>
```

### Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
integer destsize = 64;
integer datasize = 32;
boolean sub_op = (o0 == '1');
boolean unsigned = (U == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| SMNEGL | `Ra == '11111'` |

## Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Xa> Is the 64-bit name of the third general-purpose source register holding the minuend, encoded in the "Ra" field.

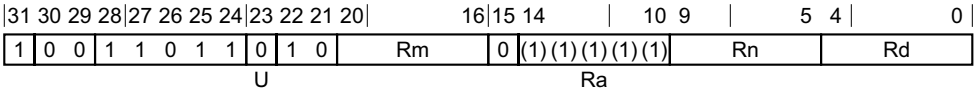
## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bits(destsize) operand3 = X[a];

integer result;

if sub_op then
    result = Int(operand3, unsigned) - (Int(operand1, unsigned) * Int(operand2, unsigned));
else
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



```
    result = Int(operand3, unsigned) + (Int(operand1, unsigned) * Int(operand2, unsigned));

X[d] = result<63:0>;
```

Non-Confidential - Beta

## C6.6.168 SMULH

Signed Multiply High multiplies two 64-bit register values, and writes bits[127:64] of the 128-bit result to the 64-bit destination register.

### 64-bit variant

```
SMULH <Xd>, <Xn>, <Xm>
```

### Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);           // ignored by UMULH/SMULH
integer destsize = 64;
integer datasize = destsize;
boolean unsigned = (U == '1');
```

## Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Xm> Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

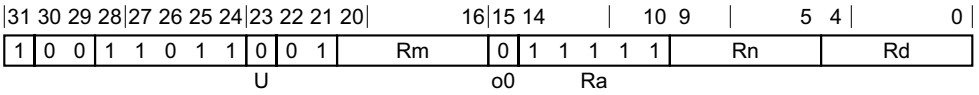
## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];

integer result;

result = Int(operand1, unsigned) * Int(operand2, unsigned);

X[d] = result<127:64>;
```



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.169 SMULL

Signed Multiply Long multiplies two 32-bit register values, and writes the result to the 64-bit destination register.

This instruction is an alias of the SMADDL instruction. This means that:

- The encodings in this description are named to match the encodings of SMADDL.
- The description of SMADDL gives the operational pseudocode for this instruction.

### *64-bit variant*

```
SMULL <Xd>, <Wn>, <Wm>
```

is equivalent to

```
SMADDL <Xd>, <Wn>, <Wm>, XZR
```

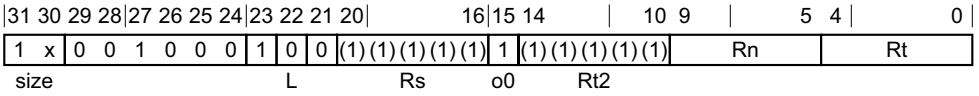
and is always the preferred disassembly.

### Assembler symbols

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.



### Operation

The description of SMADDL gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.170 STLR

Store-Release Register stores a 32-bit word or a 64-bit doubleword to a memory location, from a register. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

#### *32-bit variant*

Applies when size = 10.

```
STLR <Wt>, [<Xn|SP>{,#0}]
```

#### *64-bit variant*

Applies when size = 11.

```
STLR <Xt>, [<Xn|SP>{,#0}]
```

#### *Decode for all variants of this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

if o0 == '0' then UnallocatedEncoding();

AccType acctype = AccType_ORDERED;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = elsize;
```

### Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xt> | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |

### Operation

```
bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

case memop of
    when MemOp_STORE
        data = X[t];
        Mem[address, dbytes, acctype] = data;
```

Non-Confidential - Beta

```
when MemOp_LOAD
    data = Mem[address, dbytes, acctype];
    X[t] = ZeroExtend(data, regsize);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.171 STLRB

Store-Release Register Byte stores a byte from a 32-bit register to a memory location. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### *No offset variant*

```
STLRB <Wt>, [<Xn|SP>{,#0}]
```

### *Decode for this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

if o0 == '0' then UnallocatedEncoding();

AccType acctype = AccType_ORDERED;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = elsize;
```

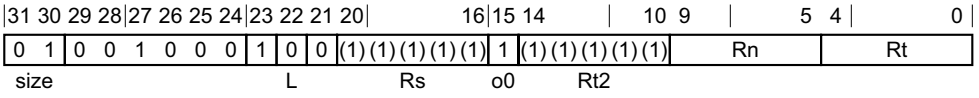
## Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |

## Operation

```
bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];



case memop of
    when MemOp_STORE
        data = X[t];
        Mem[address, dbytes, acctype] = data;

    when MemOp_LOAD
        data = Mem[address, dbytes, acctype];
        X[t] = ZeroExtend(data, regsize);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.172 STLRH

Store-Release Register Halfword stores a halfword from a 32-bit register to a memory location. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### *No offset variant*

```
STLRH <Wt>, [<Xn|SP>{,#0}]
```

### *Decode for this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

if o0 == '0' then UnallocatedEncoding();

AccType acctype = AccType_ORDERED;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = elsize;
```

## Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |

## Operation

```
bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;

if n == 31 then
    CheckSPAlignment();

### C6.6.173 STLXP

Store-Release Exclusive Pair Of Registers stores two 32-bit words or two 64-bit doublewords to a memory location if the PE has exclusive access to the memory address, from two registers, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See *Synchronization and semaphores* on page B2-107. A 32-bit pair requires the address to be doubleword aligned and is single-copy atomic at doubleword granularity. A 64-bit pair requires the address to be quadword aligned and is single-copy atomic for each doubleword at doubleword granularity. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

#### 32-bit variant

Applies when `sz = 0`.

```
STLXP <Ws>, <Wt1>, <Wt2>, [<Xn|SP>{,#0}]
```

#### 64-bit variant

Applies when `sz = 1`.

```
STLXP <Ws>, <Xt1>, <Xt2>, [<Xn|SP>{,#0}]
```

#### Decode for all variants of this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = TRUE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 32 << UInt(sz);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STLXP* on page K1-5510.

### Assembler symbols

`<Ws>` Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

`<Xt1>` Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.

`<Xt2>` Is the 64-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Wt1> Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.

<Wt2> Is the 32-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

### Aborts and alignment

If AArch64.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.

Accessing an address that is not aligned to the size of the data being accessed causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch64.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

### Operation

```
bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;
boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;

if memop == MemOp_LOAD && pair && t == t2 then
    Constraint c = ConstrainUnpredictable();
    assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
    case c of
        when Constraint_UNKNOWN    rt_unknown = TRUE;    // result is UNKNOWN
        when Constraint_UNDEF      UnallocatedEncoding();
        when Constraint_NOP        EndOfInstruction();

if memop == MemOp_STORE then
    if s == t || (pair && s == t2) then
        Constraint c = ConstrainUnpredictable();
        assert c IN {Constraint_UNKNOWN, Constraint_NONE, Constraint_UNDEF, Constraint_NOP};
        case c of
            when Constraint_UNKNOWN    rt_unknown = TRUE;    // store UNKNOWN value
            when Constraint_NONE       rt_unknown = FALSE;   // store original value
            when Constraint_UNDEF      UnallocatedEncoding();
            when Constraint_NOP        EndOfInstruction();
    if s == n && n != 31 then
        Constraint c = ConstrainUnpredictable();
        assert c IN {Constraint_UNKNOWN, Constraint_NONE, Constraint_UNDEF, Constraint_NOP};
        case c of
            when Constraint_UNKNOWN    rn_unknown = TRUE;    // address is UNKNOWN
            when Constraint_NONE       rn_unknown = FALSE;   // address is original base
            when Constraint_UNDEF      UnallocatedEncoding();
            when Constraint_NOP        EndOfInstruction();

## C6.6.174 STLXR

Store-Release Exclusive Register stores a 32-bit word or a 64-bit doubleword to memory if the PE has exclusive access to the memory address, from two registers, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See *Synchronization and semaphores* on page B2-107. The memory access is atomic. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### 32-bit variant

Applies when `size = 10`.

```
STLXR <Ws>, <Wt>, [<Xn|SP>{,#0}]
```

### 64-bit variant

Applies when `size = 11`.

```
STLXR <Ws>, <Xt>, [<Xn|SP>{,#0}]
```

### Decode for all variants of this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = FALSE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STLXR* on page K1-5510.

## Assembler symbols

`<Ws>` Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

`<Xt>` Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

## C6.6.175 STLXRB

Store-Release Exclusive Register Byte stores a byte from a 32-bit register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See *Synchronization and semaphores* on page B2-107. The memory access is atomic. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### *No offset variant*

```
STLXRB <Ws>, <Wt>, [<Xn|SP>{,#0}]
```

### *Decode for this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = FALSE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STLXRB* on page K1-5510.

### Assembler symbols

`<Ws>` Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

### Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- `<Ws>` is not updated.

If `AArch64.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

## C6.6.176 STLXRH

Store-Release Exclusive Register Halfword stores a halfword from a 32-bit register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See *Synchronization and semaphores* on page B2-107. The memory access is atomic. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### *No offset variant*

```
STLXRH <Ws>, <Wt>, [<Xn|SP>{,#0}]
```

### *Decode for this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = FALSE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STLXRH* on page K1-5511.

## Assembler symbols

`<Ws>` Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

## Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- `<Ws>` is not updated.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

A non halfword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch64.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch64.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

## Operation

## C6.6.177 STNP

Store Pair of Registers, with non-temporal hint, calculates an address from a base register value and an immediate offset, and stores two 32-bit words or two 64-bit doublewords to the calculated address, from two registers. For information about memory accesses, see *Load/Store addressing modes* on page C1-126. For information about Non-temporal pair instructions, see *Load/Store Non-temporal Pair* on page C3-145.

### *32-bit variant*

Applies when opc = 00.

```
STNP <Wt1>, <Wt2>, [<Xn|SP>{, #<imm>}]
```

### *64-bit variant*

Applies when opc = 10.

```
STNP <Xt1>, <Xt2>, [<Xn|SP>{, #<imm>}]
```

### *Decode for all variants of this encoding*

```
boolean wback  = FALSE;
boolean postindex = FALSE;
```

## Assembler symbols

| | |
|---|---|
| <Wt1> | Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field. |

## C6.6.180 STR (register)

Store Register (register) calculates an address from a base register value and an immediate offset, and stores a 32-bit word or a 64-bit doubleword to the calculated address, from a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

The instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset. The offset can be optionally shifted and extended.

### *32-bit variant*

Applies when `size = 10`.

```
STR <Wt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### *64-bit variant*

Applies when `size = 11`.

```
STR <Xt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

## Assembler symbols

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xt>` Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

`<Wm>` When `option<0>` is set to `0`, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

`<Xm>` When `option<0>` is set to `1`, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

`<extend>` Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:

- `UXTW` when `option = 010`
- `LSL` when `option = 011`
- `SXTW` when `option = 110`
- `SXTX` when `option = 111`

Non-Confidential - Beta

<amount> For the 32-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

#0 when S = 0

#2 when S = 1

For the 64-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

#0 when S = 0

#3 when S = 1

## Shared decode for all encodings

```

## C6.6.181 STRB (immediate)

Store Register Byte (immediate) calculates an address from a base register value and an immediate offset, and stores a byte from a 32-bit register to the calculated address. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### Post-index

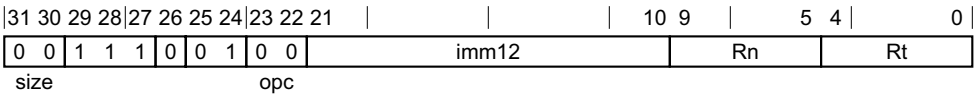
#### *Post-index variant*

```
STRB <Wt>, [<Xn|SP>], #<simm>
```

#### *Decode for this encoding*

```
boolean wback = TRUE;
boolean postindex = TRUE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Pre-index



#### *Pre-index variant*

```
STRB <Wt>, [<Xn|SP>, #<simm>]!
```

#### *Decode for this encoding*

```
boolean wback = TRUE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Unsigned offset

#### *Unsigned offset variant*

```
STRB <Wt>, [<Xn|SP>{, #<pimm>}]
```

#### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = LSL(ZeroExtend(imm12, 64), scale);
```

## C6.6.182 STRB (register)

Store Register Byte (register) calculates an address from a base register value and an immediate offset, and stores a byte from a 32-bit register to the calculated address. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

The instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset. The offset can be optionally shifted and extended.

### *Extended register variant*

Applies when `option != 011`.

```
STRB <Wt>, [<Xn|SP>, (<Wm>|<Xm>), <extend> {<amount>}]
```

### *Shifted register variant*

Applies when `option = 011`.

```
STRB <Wt>, [<Xn|SP>, <Xm>{, LSL <amount>}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

## Assembler symbols

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

`<Wm>` When `option<0>` is set to `0`, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

`<Xm>` When `option<0>` is set to `1`, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

`<extend>` Is the index extend specifier, encoded in the "option" field. It can have the following values:

- `UXTW` when `option = 010`
- `SXTW` when `option = 110`
- `SXTX` when `option = 111`

`<amount>` Is the index shift amount, it must be `#0`, encoded in "S" as `0` if omitted, or as `1` if present.

## C6.6.183 STRH (immediate)

Store Register Halfword (immediate) calculates an address from a base register value and an immediate offset, and stores a halfword from a 32-bit register to the calculated address. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### Post-index

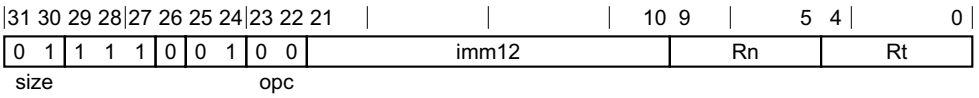
#### *Post-index variant*

```
STRH <Wt>, [<Xn|SP>], #<simm>
```

#### *Decode for this encoding*

```
boolean wback = TRUE;
boolean postindex = TRUE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Pre-index



#### *Pre-index variant*

```
STRH <Wt>, [<Xn|SP>, #<simm>]!
```

#### *Decode for this encoding*

```
boolean wback = TRUE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

### Unsigned offset

#### *Unsigned offset variant*

```
STRH <Wt>, [<Xn|SP>{, #<pimm>}]
```

#### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = LSL(ZeroExtend(imm12, 64), scale);
```

## C6.6.184 STRH (register)

Store Register Halfword (register) calculates an address from a base register value and an immediate offset, and stores a halfword from a 32-bit register to the calculated address. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

The instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an offset register value. The offset can be optionally shifted and extended.

### *32-bit variant*

```
STRH <Wt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### *Decode for this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

## Assembler symbols

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

`<Wm>` When `option<0>` is set to `0`, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

`<Xm>` When `option<0>` is set to `1`, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

`<extend>` Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:

- `UXTW` when `option = 010`
- `LSL` when `option = 011`
- `SXTW` when `option = 110`
- `SXTX` when `option = 111`

`<amount>` Is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

- `#0` when `S = 0`
- `#1` when `S = 1`

## Shared decode for all encodings

## C6.6.185 STTR

Store Register (unprivileged) stores a word or doubleword from an address in memory and zero-extends it. The address used for the store is calculated from a base register and an immediate offset. When executed at EL1, the memory access is restricted as if execution was at EL0. Otherwise, the access permission is for the Exception level at which the instruction is executed. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *32-bit variant*

Applies when `size = 10`.

```
STTR <Wt>, [<Xn|SP>{, #<simm>}]
```

### *64-bit variant*

Applies when `size = 11`.

```
STTR <Xt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

## Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xt>` | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xn\|SP>` | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| `<simm>` | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

## C6.6.188 STUR

Store Register (unscaled) calculates an address from a base register value and an immediate offset, and stores a 32-bit word or a 64-bit doubleword to the calculated address, from a register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### *32-bit variant*

Applies when `size = 10`.

```
STUR <Wt>, [<Xn|SP>{, #<simm>}]
```

### *64-bit variant*

Applies when `size = 11`.

```
STUR <Xt>, [<Xn|SP>{, #<simm>}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

## Assembler symbols

| | |
|---|---|
| `<Wt>` | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xt>` | Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| `<Xn\|SP>` | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| `<simm>` | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

## Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then
    // store or zero-extending load
    memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;
    regsize = if size == '11' then 64 else 32;
    signed = FALSE;
else
    if size == '11' then
        memop = MemOp_PREFETCH;
        if opc<0> == '1' then UnallocatedEncoding();

## C6.6.189 STURB

Store Register Byte (unscaled) calculates an address from a base register value and an immediate offset, and stores a byte to the calculated address, from a 32-bit register. For information about memory accesses, see *Load/Store addressing modes* on page C1-126.

### Unscaled offset variant

```
STURB <Wt>, [<Xn|SP>{, #<simm>}]
```

### Decode for this encoding

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

## Assembler symbols

| | |
|---|---|
| <Wt> | Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Xn\|SP> | Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field. |
| <simm> | Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field. |

## Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_NORMAL;
MemOp memop;
boolean signed;
integer regsize;

if opc<1> == '0' then
    // store or zero-extending load
    memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;
    regsize = if size == '11' then 64 else 32;
    signed = FALSE;
else
    if size == '11' then
        memop = MemOp_PREFETCH;
        if opc<0> == '1' then UnallocatedEncoding();
    else
        // sign-extending load
        memop = MemOp_LOAD;
        if size == '10' && opc<0> == '1' then UnallocatedEncoding();
        regsize = if opc<0> == '1' then 32 else 64;
        signed = TRUE;

integer datasize = 8 << scale;
```

## C6.6.191 STXP

Store Exclusive Pair Of Registers stores two 32-bit words or two 64-bit doublewords from two registers to a memory location if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See *Synchronization and semaphores* on page B2-107. A 32-bit pair requires the address to be doubleword aligned and is single-copy atomic at doubleword granularity. A 64-bit pair requires the address to be quadword aligned and is single-copy atomic for each doubleword at doubleword granularity. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### 32-bit variant

Applies when `sz = 0`.

```
STXP <Ws>, <Wt1>, <Wt2>, [<Xn|SP>{,#0}]
```

### 64-bit variant

Applies when `sz = 1`.

```
STXP <Ws>, <Xt1>, <Xt2>, [<Xn|SP>{,#0}]
```

### Decode for all variants of this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = TRUE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 32 << UInt(sz);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STXP* on page K1-5512.

## Assembler symbols

`<Ws>` Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

`<Xt1>` Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.

`<Xt2>` Is the 64-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.

`<Wt1>` Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Wt2> Is the 32-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

### Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.

Accessing an address that is not aligned to the size of the data being accessed causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch64.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch64.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

### Operation

```
bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;

## C6.6.192 STXR

Store Exclusive Register stores a 32-bit word or a 64-bit doubleword from a register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See *Synchronization and semaphores* on page B2-107. For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### 32-bit variant

Applies when `size = 10`.

```
STXR <Ws>, <Wt>, [<Xn|SP>{,#0}]
```

### 64-bit variant

Applies when `size = 11`.

```
STXR <Ws>, <Xt>, [<Xn|SP>{,#0}]
```

### Decode for all variants of this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = FALSE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STXR* on page K1-5512.

## Assembler symbols

`<Ws>` Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

`<Xt>` Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

## C6.6.193 STXRB

Store Exclusive Register Byte stores a byte from a register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See *Synchronization and semaphores* on page B2-107. The memory access is atomic.

For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### *No offset variant*

```
STXRB <Ws>, <Wt>, [<Xn|SP>{,#0}]
```

### *Decode for this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = FALSE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STXRB* on page K1-5512.

### Assembler symbols

`<Ws>` Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

### Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- `<Ws>` is not updated.

If `AArch64.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

## C6.6.194 STXRH

Store Exclusive Register Halfword stores a halfword from a register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See *Synchronization and semaphores* on page B2-107. The memory access is atomic.

For information about memory accesses see *Load/Store addressing modes* on page C1-126.

### *No offset variant*

```
STXRH <Ws>, <Wt>, [<Xn|SP>{,#0}]
```

### *Decode for this encoding*

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs);   // ignored by all loads and store-release

AccType acctype = if o0 == '1' then AccType_ORDERED else AccType_ATOMIC;
boolean pair = FALSE;
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer elsize = 8 << UInt(size);
integer regsize = if elsize == 64 then 64 else 32;
integer datasize = if pair then elsize * 2 else elsize;
```

### Assembler symbols

`<Ws>` Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

`0` If the operation updates memory.

`1` If the operation fails to update memory.

`<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

### Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- `<Ws>` is not updated.

A non halfword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch64.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch64.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

## C6.6.195 SUB (extended register)

Subtract (extended register) subtracts a sign or zero-extended register value, followed by an optional left shift amount, from a register value, and writes the result to the destination register. The argument that is extended from the <Rm> register can be a byte, halfword, word, or doubleword.

### 32-bit variant

Applies when sf = 0.

```
SUB <Wd|WSP>, <Wn|WSP>, <Wm>{, <extend> {#<amount>}}
```

### 64-bit variant

Applies when sf = 1.

```
SUB <Xd|SP>, <Xn|SP>, <R><m>{, <extend> {#<amount>}}
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
ExtendType extend_type = DecodeRegExtend(option);
integer shift = UInt(imm3);
if shift > 4 then ReservedValue();
```

## Assembler symbols

<Wd|WSP> Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

<Wn|WSP> Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

<Xd|SP> Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

<R> Is a width specifier, encoded in the "option" field. It can have the following values:

| | |
|---|---|
| W | when option = 00x |
| W | when option = 010 |
| X | when option = x11 |
| W | when option = 10x |
| W | when option = 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<m> Is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.

<extend> For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

LSL|UXTW when option = 010

UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

SXTX when option = 111

If "Rd" or "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

UXTW when option = 010

LSL|UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

SXTX when option = 111

If "Rd" or "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTX when "option" is '011'.

<amount> Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

## Operation

```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = ExtendReg(m, extend_type, shift);
bits(4) nzcv;
bit carry_in;

if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';

(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);

if setflags then
    PSTATE.<N,Z,C,V> = nzcv;

if d == 31 && !setflags then
```

### C6.6.196 SUB (immediate)

Subtract (immediate) subtracts an optionally-shifted immediate value from a register value, and writes the result to the destination register.

#### *32-bit variant*

Applies when `sf = 0`.

```
SUB <Wd|WSP>, <Wn|WSP>, #<imm>{, <shift>}
```

#### *64-bit variant*

Applies when `sf = 1`.

```
SUB <Xd|SP>, <Xn|SP>, #<imm>{, <shift>}
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
bits(datasize) imm;

case shift of
    when '00' imm = ZeroExtend(imm12, datasize);
    when '01' imm = ZeroExtend(imm12 : Zeros(12), datasize);
    when '1x' ReservedValue();
```

### Assembler symbols

`<Wd|WSP>` Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

`<Wn|WSP>` Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

`<Xd|SP>` Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

`<Xn|SP>` Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

`<imm>` Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.

`<shift>` Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "shift" field. It can have the following values:

`LSL #0` when `shift = 00`

`LSL #12` when `shift = 01`

The encoding `shift = 1x` is reserved.

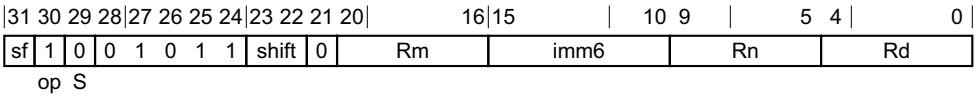
## Operation

```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = imm;
bits(4) nzcv;
bit carry_in;

if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';

(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);

if setflags then
    PSTATE.<N,Z,C,V> = nzcv;



if d == 31 && !setflags then
    SP[] = result;
else
    X[d] = result;
```

Non-Confidential - Beta

## C6.6.197 SUB (shifted register)

Subtract (shifted register) subtracts an optionally-shifted register value from a register value, and writes the result to the destination register.

This instruction is used by the alias NEG (shifted register). See the *Alias conditions* table for details of when each alias is preferred.

### *32-bit variant*

Applies when `sf = 0`.

```
SUB <Wd>, <Wn>, <Wm>{, <shift> #<amount>}
```

### *64-bit variant*

Applies when `sf = 1`.

```
SUB <Xd>, <Xn>, <Xm>{, <shift> #<amount>}
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');

if shift == '11' then ReservedValue();
if sf == '0' && imm6<5> == '1' then ReservedValue();

ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| NEG (shifted register) | `Rn == '11111'` |

## Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Wm>` | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| `<Xm>` | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<shift> Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

LSL when shift = 00

LSR when shift = 01

ASR when shift = 10

The encoding shift = 11 is reserved.

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

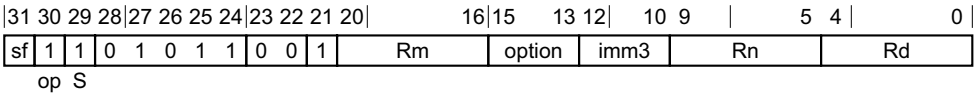
## Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);
bits(4) nzcv;
bit carry_in;

if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';

(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);

if setflags then
    PSTATE.<N,Z,C,V> = nzcv;



X[d] = result;
```

Non-Confidential - Beta

## C6.6.198 SUBS (extended register)

Subtract (extended register), setting flags, subtracts a sign or zero-extended register value, followed by an optional left shift amount, from a register value, and writes the result to the destination register. The argument that is extended from the <Rm> register can be a byte, halfword, word, or doubleword. It updates the condition flags based on the result.

This instruction is used by the alias CMP (extended register). See the *Alias conditions* table for details of when each alias is preferred.

### *32-bit variant*

Applies when `sf = 0`.

```
SUBS <Wd>, <Wn|WSP>, <Wm>{, <extend> {#<amount>}}
```

### *64-bit variant*

Applies when `sf = 1`.

```
SUBS <Xd>, <Xn|SP>, <R><m>{, <extend> {#<amount>}}
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
ExtendType extend_type = DecodeRegExtend(option);
integer shift = UInt(imm3);
if shift > 4 then ReservedValue();
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| CMP (extended register) | `Rd == '11111'` |

## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn\|WSP> | Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field. |
| <Wm> | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn\|SP> | Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<R> Is a width specifier, encoded in the "option" field. It can have the following values:

W when option = 00x

W when option = 010

X when option = x11

W when option = 10x

W when option = 110

<m> Is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.

<extend> For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

LSL|UXTW when option = 010

UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

SXTX when option = 111

If "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB when option = 000

UXTH when option = 001

UXTW when option = 010

LSL|UXTX when option = 011

SXTB when option = 100

SXTH when option = 101

SXTW when option = 110

SXTX when option = 111

If "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTX when "option" is '011'.

<amount> Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

## Operation

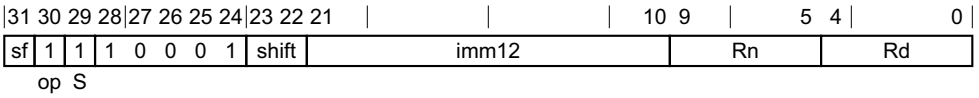
```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = ExtendReg(m, extend_type, shift);
bits(4) nzcv;
bit carry_in;

if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);

if setflags then
    PSTATE.<N,Z,C,V> = nzcv;



if d == 31 && !setflags then
    SP[] = result;
else
    X[d] = result;
```

Non-Confidential - Beta

## C6.6.199 SUBS (immediate)

Subtract (immediate), setting flags, subtracts an optionally-shifted immediate value from a register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias CMP (immediate). See the *Alias conditions* table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0`.

```
SUBS <Wd>, <Wn|WSP>, #<imm>{, <shift>}
```

### 64-bit variant

Applies when `sf = 1`.

```
SUBS <Xd>, <Xn|SP>, #<imm>{, <shift>}
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');
bits(datasize) imm;

case shift of
    when '00' imm = ZeroExtend(imm12, datasize);
    when '01' imm = ZeroExtend(imm12 : Zeros(12), datasize);
    when '1x' ReservedValue();
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| CMP (immediate) | `Rd == '11111'` |

## Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn|WSP>` Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn|SP>` Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

`<imm>` Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.

`<shift>` Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "shift" field. It can have the following values:

`LSL #0` when `shift = 00`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`LSL #12` when `shift = 01`

The encoding `shift = 1x` is reserved.

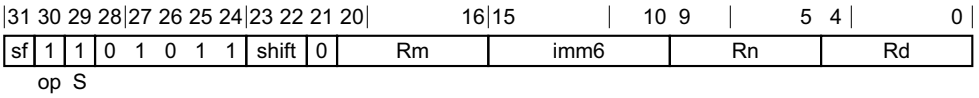
## Operation

```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = imm;
bits(4) nzcv;
bit carry_in;

if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';

(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);

if setflags then
    PSTATE.<N,Z,C,V> = nzcv;



if d == 31 && !setflags then
    SP[] = result;
else
    X[d] = result;
```

## C6.6.200 SUBS (shifted register)

Subtract (shifted register), setting flags, subtracts an optionally-shifted register value from a register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the aliases CMP (shifted register) and NEGS. See the *Alias conditions* table for details of when each alias is preferred.

### *32-bit variant*

Applies when `sf = 0`.

```
SUBS <Wd>, <Wn>, <Wm>{, <shift> #<amount>}
```

### *64-bit variant*

Applies when `sf = 1`.

```
SUBS <Xd>, <Xn>, <Xm>{, <shift> #<amount>}
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean sub_op = (op == '1');
boolean setflags = (S == '1');

if shift == '11' then ReservedValue();
if sf == '0' && imm6<5> == '1' then ReservedValue();

ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| CMP (shifted register) | `Rd == '11111'` |
| NEGS | `Rn == '11111'` |

## Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Xm> Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

LSL when shift = 00

LSR when shift = 01

ASR when shift = 10

The encoding shift = 11 is reserved.

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

## Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);
bits(4) nzcv;
bit carry_in;

if sub_op then
    operand2 = NOT(operand2);
    carry_in = '1';
else
    carry_in = '0';

(result, nzcv) = AddWithCarry(operand1, operand2, carry_in);

if setflags then
    PSTATE.<N,Z,C,V> = nzcv;

X[d] = result;
```

## C6.6.201 SVC

Supervisor Call causes an exception to be taken to EL1.

On executing an SVC instruction, the PE records the exception as a Supervisor Call exception, using the EC value 0x15, and the value of the immediate argument. This is reported in:

- ESR_ELx, if the exception is taken to an Exception level that is using AArch64.
- HSR, if the exception is taken to an Exception level that is using AArch32. See *Use of the HSR* on page G4-4105.

### *System variant*

```
SVC #<imm>
```

### *Decode for this encoding*

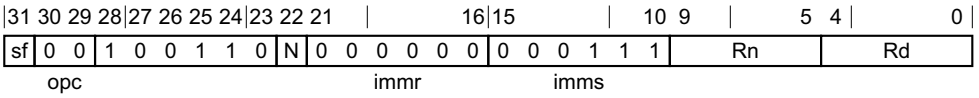
```
bits(16) imm = imm16;
```

### Assembler symbols

<imm> Is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.

### Operation

```
AArch64.CallSupervisor(imm);
```



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.202 SXTB

Signed Extend Byte extracts an 8-bit value from a register, sign-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0 && N = 0`.

```
SXTB <Wd>, <Wn>
```

is equivalent to

```
SBFM <Wd>, <Wn>, #0, #7
```

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1 && N = 1`.

```
SXTB <Xd>, <Wn>
```

is equivalent to

```
SBFM <Xd>, <Xn>, #0, #7
```

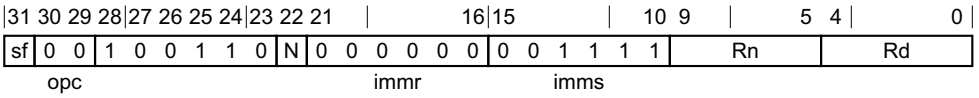
and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| <Wn> | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |

### Operation

The description of SBFM gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.203 SXTH

Sign Extend Halfword extracts a 16-bit value, sign-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0 && N = 0`.

`SXTH <Wd>, <Wn>`

is equivalent to

`SBFM <Wd>, <Wn>, #0, #15`

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1 && N = 1`.

`SXTH <Xd>, <Wn>`

is equivalent to

`SBFM <Xd>, <Xn>, #0, #15`

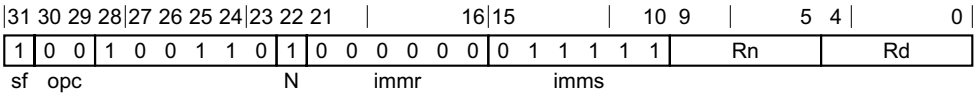
and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |

### Operation

The description of SBFM gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.204 SXTW

Sign Extend Word sign-extends a word to the size of the register, and writes the result to the destination register.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

### *64-bit variant*

```
SXTW <Xd>, <Wn>
```

is equivalent to

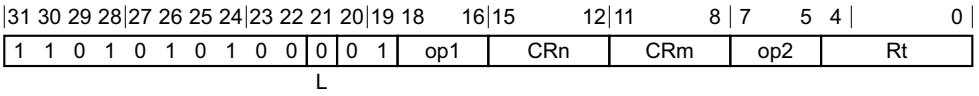
```
SBFM <Xd>, <Xn>, #0, #31
```

and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |

### Operation



The description of SBFM gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.205 SYS

System instruction. For more information, see *op0==0b01, cache maintenance, TLB maintenance, and address translation instructions* on page C5-271 for the encodings of System instructions.

This instruction is used by the aliases AT, DC, IC, and TLBI. See the *Alias conditions* table for details of when each alias is preferred.

### System variant

```
SYS #<op1>, <Cn>, <Cm>, #<op2>{, <Xt>}
```

### Decode for this encoding

```
CheckSystemAccess('01', op1, CRn, CRm, op2, Rt, L);

integer t = UInt(Rt);

integer sys_op0 = 1;
integer sys_op1 = UInt(op1);
integer sys_op2 = UInt(op2);
integer sys_crn = UInt(CRn);
integer sys_crm = UInt(CRm);
boolean has_result = (L == '1');
```

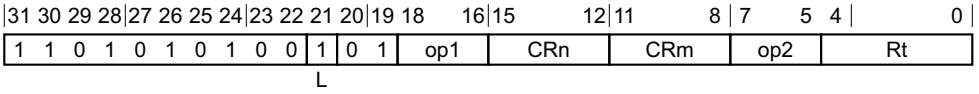
### Alias conditions

| Alias | is preferred when |
|---|---|
| AT | `CRn == '0111' && CRm == '1000' && SysOp(op1,'0111','1000',op2) == Sys_AT` |
| DC | `CRn == '0111' && SysOp(op1,'0111',CRm,op2) == Sys_DC` |
| IC | `CRn == '0111' && SysOp(op1,'0111',CRm,op2) == Sys_IC` |
| TLBI | `CRn == '1000' && SysOp(op1,'1000',CRm,op2) == Sys_TLBI` |

### Assembler symbols

| | |
|---|---|
| <op1> | Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field. |
| <Cn> | Is a name 'Cn', with 'n' in the range 0 to 15, encoded in the "CRn" field. |
| <Cm> | Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field. |
| <op2> | Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field. |
| <Xt> | Is the 64-bit name of the optional general-purpose source register, defaulting to '11111', encoded in the "Rt" field. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



## Operation

```
if has_result then
    X[t] = SysOp_R(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2);
else
    SysOp_W(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2, X[t]);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.206 SYSL

System instruction with result. For more information, see *op0==0b01, cache maintenance, TLB maintenance, and address translation instructions* on page C5-271 for the encodings of System instructions.

### System variant

```
SYSL <Xt>, #<op1>, <Cn>, <Cm>, #<op2>
```

### Decode for this encoding

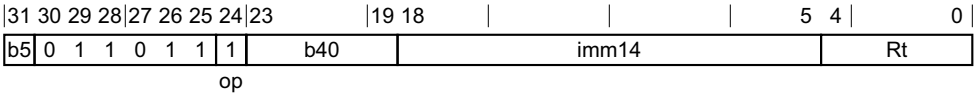
```
CheckSystemAccess('01', op1, CRn, CRm, op2, Rt, L);

integer t = UInt(Rt);

integer sys_op0 = 1;
integer sys_op1 = UInt(op1);
integer sys_op2 = UInt(op2);
integer sys_crn = UInt(CRn);
integer sys_crm = UInt(CRm);
boolean has_result = (L == '1');
```

## Assembler symbols

| | |
|---|---|
| <Xt> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rt" field. |
| <op1> | Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field. |
| <Cn> | Is a name 'Cn', with 'n' in the range 0 to 15, encoded in the "CRn" field. |
| <Cm> | Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field. |
| <op2> | Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field. |



## Operation

```
if has_result then
    X[t] = SysOp_R(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2);
else
    SysOp_W(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2, X[t]);
```

## C6.6.207 TBNZ

Test bit and Branch if Nonzero compares the value of a bit in a general-purpose register with zero, and conditionally branches to a label at a PC-relative offset if the comparison is not equal. It provides a hint that this is not a subroutine call or return. This instruction does not affect condition flags.

### 14-bit signed PC-relative branch offset variant

```
TBNZ <R><t>, #<imm>, <label>
```

### Decode for this encoding

```
integer t = UInt(Rt);

integer datasize = if b5 == '1' then 64 else 32;
integer bit_pos = UInt(b5:b40);
bit bit_val = op;
bits(64) offset = SignExtend(imm14:'00', 64);
```

## Assembler symbols

<R> Is a width specifier, encoded in the "b5" field. It can have the following values:

W when b5 = 0

X when b5 = 1

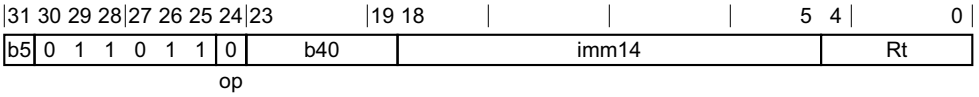
In assembler source code an 'X' specifier is always permitted, but a 'W' specifier is only permitted when the bit number is less than 32.

<t> Is the number [0-30] of the general-purpose register to be tested or the name ZR (31), encoded in the "Rt" field.

<imm> Is the bit number to be tested, in the range 0 to 63, encoded in "b5:b40".

<label> Is the program label to be conditionally branched to. Its offset from the address of this instruction, in the range +/-32KB, is encoded as "imm14" times 4.

## Operation



```
bits(datasize) operand = X[t];

if operand<bit_pos> == bit_val then
    BranchTo(PC[] + offset, BranchType_JMP);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.208 TBZ

Test bit and Branch if Zero compares the value of a test bit with zero, and conditionally branches to a label at a PC-relative offset if the comparison is equal. It provides a hint that this is not a subroutine call or return. This instruction does not affect condition flags.

### 14-bit signed PC-relative branch offset variant

```
TBZ <R><t>, #<imm>, <label>
```

### Decode for this encoding

```
integer t = UInt(Rt);

integer datasize = if b5 == '1' then 64 else 32;
integer bit_pos = UInt(b5:b40);
bit bit_val = op;
bits(64) offset = SignExtend(imm14:'00', 64);
```

## Assembler symbols

<R> Is a width specifier, encoded in the "b5" field. It can have the following values:

W when b5 = 0

X when b5 = 1

In assembler source code an 'X' specifier is always permitted, but a 'W' specifier is only permitted when the bit number is less than 32.

<t> Is the number [0-30] of the general-purpose register to be tested or the name ZR (31), encoded in the "Rt" field.

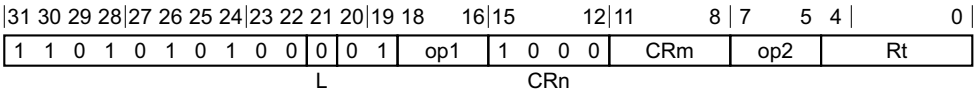
<imm> Is the bit number to be tested, in the range 0 to 63, encoded in "b5:b40".

<label> Is the program label to be conditionally branched to. Its offset from the address of this instruction, in the range +/-32KB, is encoded as "imm14" times 4.

## Operation

```
bits(datasize) operand = X[t];

if operand<bit_pos> == bit_val then
    BranchTo(PC[] + offset, BranchType_JMP);
```



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

## C6.6.209 TLBI

TLB Invalidate operation. For more information, see A64 system instructions for TLB maintenance.

This instruction is an alias of the SYS instruction. This means that:

- The encodings in this description are named to match the encodings of SYS.
- The description of SYS gives the operational pseudocode for this instruction.

### *System variant*

```
TLBI <tlbi_op>{, <Xt>}
```

is equivalent to

```
SYS #<op1>, C8, <Cm>, #<op2>{, <Xt>}
```

and is the preferred disassembly when `SysOp(op1,'1000',CRm,op2) == Sys_TLBI`.

### Assembler symbols

`<op1>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.

`<Cm>` Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.

`<op2>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

`<tlbi_op>` Is a TLBI operation name, as listed for the TLBI system operation group, encoded in the "op1:CRm:op2" field. It can have the following values:

| | |
|---|---|
| `VMALLE1IS` | when `op1 = 000, CRm = 0011, op2 = 000` |
| `VAE1IS` | when `op1 = 000, CRm = 0011, op2 = 001` |
| `ASIDE1IS` | when `op1 = 000, CRm = 0011, op2 = 010` |
| `VAAE1IS` | when `op1 = 000, CRm = 0011, op2 = 011` |
| `VALE1IS` | when `op1 = 000, CRm = 0011, op2 = 101` |
| `VAALE1IS` | when `op1 = 000, CRm = 0011, op2 = 111` |
| `VMALLE1` | when `op1 = 000, CRm = 0111, op2 = 000` |
| `VAE1` | when `op1 = 000, CRm = 0111, op2 = 001` |
| `ASIDE1` | when `op1 = 000, CRm = 0111, op2 = 010` |
| `VAAE1` | when `op1 = 000, CRm = 0111, op2 = 011` |
| `VALE1` | when `op1 = 000, CRm = 0111, op2 = 101` |
| `VAALE1` | when `op1 = 000, CRm = 0111, op2 = 111` |
| `IPAS2E1IS` | when `op1 = 100, CRm = 0000, op2 = 001` |
| `IPAS2LE1IS` | when `op1 = 100, CRm = 0000, op2 = 101` |
| `ALLE2IS` | when `op1 = 100, CRm = 0011, op2 = 000` |
| `VAE2IS` | when `op1 = 100, CRm = 0011, op2 = 001` |
| `ALLE1IS` | when `op1 = 100, CRm = 0011, op2 = 100` |
| `VALE2IS` | when `op1 = 100, CRm = 0011, op2 = 101` |

### C6.6.210 TST (immediate)

Test bits (immediate) , setting the condition flags and discarding the result : `Rn AND imm`

This instruction is an alias of the ANDS (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of ANDS (immediate).
- The description of ANDS (immediate) gives the operational pseudocode for this instruction.

#### *32-bit variant*

Applies when `sf = 0 && N = 0`.

```
TST <Wn>, #<imm>
```

is equivalent to

```
ANDS WZR, <Wn>, #<imm>
```

and is always the preferred disassembly.

#### *64-bit variant*

Applies when `sf = 1`.

```
TST <Xn>, #<imm>
```

is equivalent to

```
ANDS XZR, <Xn>, #<imm>
```

and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<imm>` | For the 32-bit variant: is the bitmask immediate, encoded in "imms:immr".<br>For the 64-bit variant: is the bitmask immediate, encoded in "N:imms:immr". |

### Operation

The description of ANDS (immediate) gives the operational pseudocode for this instruction.

Non-Confidential - Beta

## C6.6.211 TST (shifted register)

Test (shifted register) performs a bitwise AND operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the ANDS (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of ANDS (shifted register).
- The description of ANDS (shifted register) gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0`.

```
TST <Wn>, <Wm>{, <shift> #<amount>}
```

is equivalent to

```
ANDS WZR, <Wn>, <Wm>{, <shift> #<amount>}
```

and is always the preferred disassembly.

### *64-bit variant*

Applies when `sf = 1`.

```
TST <Xn>, <Xm>{, <shift> #<amount>}
```

is equivalent to

```
ANDS XZR, <Xn>, <Xm>{, <shift> #<amount>}
```

and is always the preferred disassembly.

### Assembler symbols

`<Wn>` Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<Xn>` Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

`<Xm>` Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- `LSL` when `shift = 00`
- `LSR` when `shift = 01`
- `ASR` when `shift = 10`
- `ROR` when `shift = 11`

`<amount>` For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

## C6.6.212 UBFIZ

Unsigned Bitfield Insert in Zero zeroes the destination register and copies any number of contiguous bits from a source register into any position in the destination register.

This instruction is an alias of the UBFM instruction. This means that:

- The encodings in this description are named to match the encodings of UBFM.
- The description of UBFM gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0 && N = 0`.

`UBFIZ <Wd>, <Wn>, #<lsb>, #<width>`

is equivalent to

`UBFM <Wd>, <Wn>, #(-<lsb> MOD 32), #(<width>-1)`

and is the preferred disassembly when `UInt(imms) < UInt(immr)`.

### *64-bit variant*

Applies when `sf = 1 && N = 1`.

`UBFIZ <Xd>, <Xn>, #<lsb>, #<width>`

is equivalent to

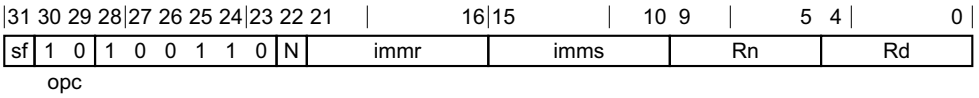
`UBFM <Xd>, <Xn>, #(-<lsb> MOD 64), #(<width>-1)`

and is the preferred disassembly when `UInt(imms) < UInt(immr)`.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Wn>` | Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xn>` | Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field. |
| `<lsb>` | For the 32-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 31.<br>For the 64-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 63. |
| `<width>` | For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<lsb>.<br>For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<lsb>. |

### Operation



The description of UBFM gives the operational pseudocode for this instruction.

## C6.6.213 UBFM

Unsigned Bitfield Move copies any number of low-order bits from a source register into the same number of adjacent bits at any position in the destination register, with zeros in the upper and lower bits.

This instruction is used by the aliases LSL (immediate), LSR (immediate), UBFIZ, UBFX, UXTB, and UXTH. See the *Alias conditions* on page C6-819 table for details of when each alias is preferred.

### 32-bit variant

Applies when `sf = 0 && N = 0`.

```
UBFM <Wd>, <Wn>, #<immr>, #<imms>
```

### 64-bit variant

Applies when `sf = 1 && N = 1`.

```
UBFM <Xd>, <Xn>, #<immr>, #<imms>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;

boolean inzero;
boolean extend;
integer R;
integer S;
bits(datasize) wmask;
bits(datasize) tmask;

case opc of
    when '00' inzero = TRUE;  extend = TRUE;    // SBFM
    when '01' inzero = FALSE; extend = FALSE;   // BFM
    when '10' inzero = TRUE;  extend = FALSE;   // UBFM
    when '11' UnallocatedEncoding();

if sf == '1' && N != '1' then ReservedValue();
if sf == '0' && (N != '0' || immr<5> != '0' || imms<5> != '0') then ReservedValue();

R = UInt(immr);
S = UInt(imms);
(wmask, tmask) = DecodeBitMasks(N, imms, immr, FALSE);
```

Non-Confidential - Beta

### Alias conditions

| Alias | of variant | is preferred when |
|---|---|---|
| LSL (immediate) | 32-bit | `imms != '011111' && imms + 1 == immr` |
| LSL (immediate) | 64-bit | `imms != '111111' && imms + 1 == immr` |
| LSR (immediate) | 32-bit | `imms == '011111'` |
| LSR (immediate) | 64-bit | `imms == '111111'` |
| UBFIZ | - | `UInt(imms) < UInt(immr)` |
| UBFX | - | `BFXPreferred(sf, opc<1>, imms, immr)` |
| UXTB | - | `immr == '000000' && imms == '000111'` |
| UXTH | - | `immr == '000000' && imms == '001111'` |

### Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

<immr> For the 32-bit variant: is the right rotate amount, in the range 0 to 31, encoded in the "immr" field.

For the 64-bit variant: is the right rotate amount, in the range 0 to 63, encoded in the "immr" field.

<imms> For the 32-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 31, encoded in the "imms" field.

For the 64-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 63, encoded in the "imms" field.

### Operation

```
bits(datasize) dst = if inzero then Zeros() else X[d];
bits(datasize) src = X[n];

// perform bitfield move on low bits
bits(datasize) bot = (dst AND NOT(wmask)) OR (ROR(src, R) AND wmask);

// determine extension bits (sign, zero or dest register)
bits(datasize) top = if extend then Replicate(src<S>) else dst;

// combine extension bits and result bits
X[d] = (top AND NOT(tmask)) OR (bot AND tmask);
```

## C6.6.214 UBFX

Unsigned Bitfield Extract extracts any number of adjacent bits at any position from a register, zero-extends them to the size of the register, and writes the result to the destination register.

This instruction is an alias of the UBFM instruction. This means that:

- The encodings in this description are named to match the encodings of UBFM.
- The description of UBFM gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `sf = 0 && N = 0`.

`UBFX <Wd>, <Wn>, #<lsb>, #<width>`

is equivalent to

`UBFM <Wd>, <Wn>, #<lsb>, #(<lsb>+<width>-1)`

and is the preferred disassembly when `BFXPreferred(sf, opc<1>, imms, immr)`.

### *64-bit variant*

Applies when `sf = 1 && N = 1`.

`UBFX <Xd>, <Xn>, #<lsb>, #<width>`

is equivalent to

`UBFM <Xd>, <Xn>, #<lsb>, #(<lsb>+<width>-1)`

and is the preferred disassembly when `BFXPreferred(sf, opc<1>, imms, immr)`.

## Assembler symbols

Non-Confidential - Beta

## C6.6.215 UDIV

Unsigned Divide divides an unsigned integer register value by another unsigned integer register value, and writes the result to the destination register. The condition flags are not affected.

### 32-bit variant

Applies when `sf = 0`.

```
UDIV <Wd>, <Wn>, <Wm>
```

### 64-bit variant

Applies when `sf = 1`.

```
UDIV <Xd>, <Xn>, <Xm>
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
boolean unsigned = (o1 == '0');
```

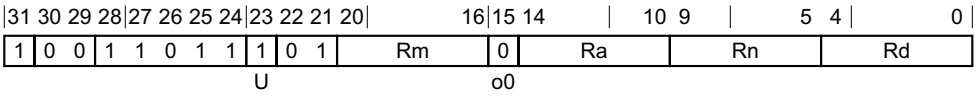
## Assembler symbols

| | |
|---|---|
| <Wd> | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Wn> | Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Wm> | Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field. |
| <Xd> | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| <Xn> | Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field. |
| <Xm> | Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field. |

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
integer result;

if IsZero(operand2) then
    result = 0;
else
    result = RoundTowardsZero(Real(Int(operand1, unsigned)) / Real(Int(operand2, unsigned)));



X[d] = result<datasize-1:0>;
```

Non-Confidential - Beta

## C6.6.216 UMADDL

Unsigned Multiply-Add Long multiplies two 32-bit register values, adds a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias UMULL. See the *Alias conditions* table for details of when each alias is preferred.

### 64-bit variant

```
UMADDL <Xd>, <Wn>, <Wm>, <Xa>
```

### Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
integer destsize = 64;
integer datasize = 32;
boolean sub_op = (o0 == '1');
boolean unsigned = (U == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| UMULL | `Ra == '11111'` |

## Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Xa> Is the 64-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bits(destsize) operand3 = X[a];

integer result;

if sub_op then
    result = Int(operand3, unsigned) - (Int(operand1, unsigned) * Int(operand2, unsigned));
else
```

## C6.6.217 UMNEGL

Unsigned Multiply-Negate Long multiplies two 32-bit register values, negates the product, and writes the result to the 64-bit destination register.

This instruction is an alias of the UMSUBL instruction. This means that:

- The encodings in this description are named to match the encodings of UMSUBL.
- The description of UMSUBL gives the operational pseudocode for this instruction.

### *64-bit variant*

```
UMNEGL <Xd>, <Wn>, <Wm>
```

is equivalent to

```
UMSUBL <Xd>, <Wn>, <Wm>, XZR
```

and is always the preferred disassembly.

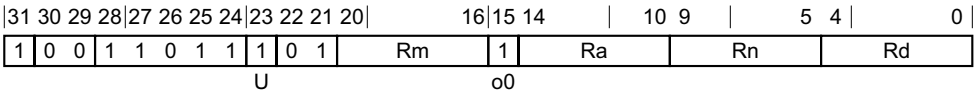
### Assembler symbols

`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

### Operation



The description of UMSUBL gives the operational pseudocode for this instruction.

Non-Confidential - Beta

## C6.6.218 UMSUBL

Unsigned Multiply-Subtract Long multiplies two 32-bit register values, subtracts the product from a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias UMNEGL. See the *Alias conditions* table for details of when each alias is preferred.

### 64-bit variant

```
UMSUBL <Xd>, <Wn>, <Wm>, <Xa>
```

### Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
integer destsize = 64;
integer datasize = 32;
boolean sub_op = (o0 == '1');
boolean unsigned = (U == '1');
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| UMNEGL | `Ra == '11111'` |

## Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Xa> Is the 64-bit name of the third general-purpose source register holding the minuend, encoded in the "Ra" field.

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bits(destsize) operand3 = X[a];

integer result;

if sub_op then
    result = Int(operand3, unsigned) - (Int(operand1, unsigned) * Int(operand2, unsigned));
else
```

## C6.6.219 UMULH

Unsigned Multiply High multiplies two 64-bit register values, and writes bits[127:64] of the 128-bit result to the 64-bit destination register.

### 64-bit variant

```
UMULH <Xd>, <Xn>, <Xm>
```

### Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);           // ignored by UMULH/SMULH
integer destsize = 64;
integer datasize = destsize;
boolean unsigned = (U == '1');
```

## Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Xm> Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

## Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];

integer result;

result = Int(operand1, unsigned) * Int(operand2, unsigned);

X[d] = result<127:64>;
```

Non-Confidential - Beta

## C6.6.220 UMULL

Unsigned Multiply Long multiplies two 32-bit register values, and writes the result to the 64-bit destination register.

This instruction is an alias of the UMADDL instruction. This means that:

- The encodings in this description are named to match the encodings of UMADDL.
- The description of UMADDL gives the operational pseudocode for this instruction.

### *64-bit variant*

```
UMULL <Xd>, <Wn>, <Wm>
```

is equivalent to

```
UMADDL <Xd>, <Wn>, <Wm>, XZR
```

and is always the preferred disassembly.

### Assembler symbols

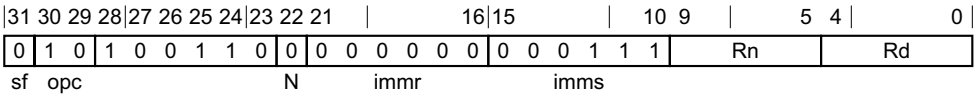
`<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

`<Wm>` Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

### Operation

The description of UMADDL gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.221 UXTB

Unsigned Extend Byte extracts an 8-bit value from a register, zero-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the UBFM instruction. This means that:

- The encodings in this description are named to match the encodings of UBFM.
- The description of UBFM gives the operational pseudocode for this instruction.

### *32-bit variant*

`UXTB <Wd>, <Wn>`

is equivalent to

`UBFM <Wd>, <Wn>, #0, #7`

and is always the preferred disassembly.

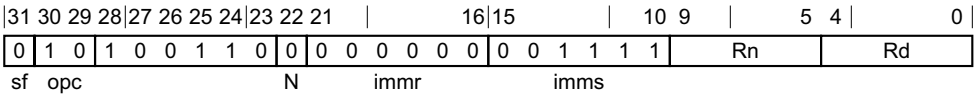
### Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

`<Wn>` Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

### Operation

The description of UBFM gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C6.6.222 UXTH

Unsigned Extend Halfword extracts a 16-bit value from a register, zero-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the UBFM instruction. This means that:

- The encodings in this description are named to match the encodings of UBFM.
- The description of UBFM gives the operational pseudocode for this instruction.

### *32-bit variant*

```
UXTH <Wd>, <Wn>
```

is equivalent to

```
UBFM <Wd>, <Wn>, #0, #15
```

and is always the preferred disassembly.

### Assembler symbols

`<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

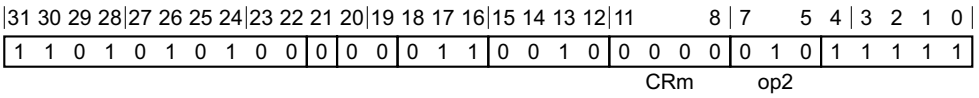
`<Wn>` Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

### Operation

The description of UBFM gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.223 WFE



Wait For Event is a hint instruction that permits the PE to enter a low-power state until one of a number of events occurs, including events signaled by executing the SEV instruction on any PE in the multiprocessor system. For more information, see *Wait for Event mechanism and Send event* on page D1-1611.

As described in *Wait for Event mechanism and Send event* on page D1-1611, the execution of a WFE instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level. See:

- *Traps to EL1 of EL0 execution of WFE and WFI instructions* on page D1-1578.
- *Traps to EL2 of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page D1-1594.
- *Traps to EL3 of EL2, EL1, and EL0 execution of WFE and WFI instructions* on page D1-1603.

This instruction is an alias of the HINT instruction. This means that:

- The encodings in this description are named to match the encodings of HINT.
- The description of HINT gives the operational pseudocode for this instruction.

#### *System variant*

```
WFE
```

is equivalent to

```
HINT #2
```

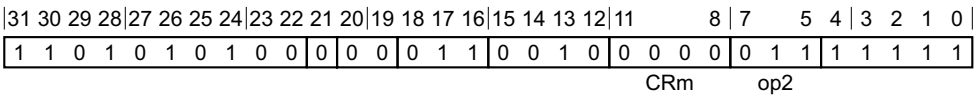
and is always the preferred disassembly.

### Operation

The description of HINT gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C6.6.224 WFI



Wait For Interrupt is a hint instruction that permits the PE to enter a low-power state until one of a number of asynchronous event occurs. For more information, see *Wait For Interrupt* on page D1-1614.

As described in *Wait For Interrupt* on page D1-1614, the execution of a `WFI` instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level. See:

- *Traps to EL1 of EL0 execution of WFE and WFI instructions* on page D1-1578.
- *Traps to EL2 of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page D1-1594.
- *Traps to EL3 of EL2, EL1, and EL0 execution of WFE and WFI instructions* on page D1-1603.

This instruction is an alias of the HINT instruction. This means that:

- The encodings in this description are named to match the encodings of HINT.
- The description of HINT gives the operational pseudocode for this instruction.

#### *System variant*

`WFI`

is equivalent to

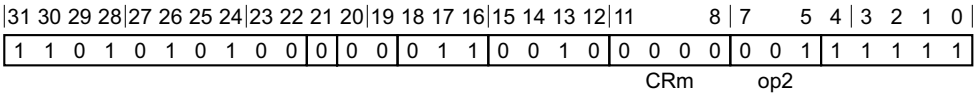
`HINT #3`

and is always the preferred disassembly.

### Operation

The description of HINT gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



## C6.6.225 YIELD

YIELD is a hint instruction. Software with a multithreading capability can use a `YIELD` instruction to indicate to the PE that it is performing a task, for example a spin-lock, that could be swapped out to improve overall system performance. The PE can use this hint to suspend and resume multiple software threads if it supports the capability.

For more information about the recommended use of this instruction, see *The YIELD instruction* on page B1-64.

This instruction is an alias of the HINT instruction. This means that:

- The encodings in this description are named to match the encodings of HINT.
- The description of HINT gives the operational pseudocode for this instruction.

### *System variant*

`YIELD`

is equivalent to

`HINT #1`

and is always the preferred disassembly.

### Operation

The description of HINT gives the operational pseudocode for this instruction.

# Chapter C7
# A64 Advanced SIMD and Floating-point Instruction Descriptions

This chapter describes the A64 SIMD and floating-point instructions.

It contains the following sections:

- *Introduction* on page C7-836.
- *About the SIMD and floating-point instructions* on page C7-837.
- *Alphabetical list of floating-point and Advanced SIMD instructions* on page C7-839.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## C7.1 Introduction

*Alphabetical list of floating-point and Advanced SIMD instructions* on page C7-839 is an alphabetical list of instructions that are part of the following two functional groups:

- Loads and store instructions associated with the SIMD and floating-point registers.
- Data processing instructions with SIMD and floating-point registers.

*A64 instruction index by encoding* on page C4-186 in the A64 Instruction Encodings chapter provides an overview of the instruction encodings as part of an instruction class within a functional group.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

## C7.2 About the SIMD and floating-point instructions

This section provides a general description of the SIMD and floating-point instructions. It contains the following subsections:

- *Register size*.
- *Data types*.
- *Condition flags and related instructions* on page C7-838.
- *General capabilities* on page C7-838.

### C7.2.1 Register size

A64 provides a comprehensive set of packed Single Instruction Multiple Data (SIMD) and scalar operations using data held in the 32 entry 128-bit wide SIMD and floating-point register file.

Each SIMD and floating-point register can be used to hold:

- A single scalar value of the floating-point or integer type.
- A 64-bit wide vector containing one or more elements.
- A 128-bit wide vector containing two or more elements.

Where the entire 128-bit wide register is not fully utilized, the vector or scalar quantity is held in the least significant bits of the register, with the most significant bits being cleared to zero on a write, see *Vector formats* on page A1-37.

The following instructions can insert data into individual elements within a SIMD and floating-pointer register without clearing the remaining bits to zero:

- Insert vector element from another vector element or general-purpose register, `INS`.
- Load structure into a single lane, for example `LD3`.
- All second-part narrowing operations, for example `SHRN2`.

### C7.2.2 Data types

The A64 instruction set provides support for arithmetic, conversion, and bitwise operations on:

- Half-precision, single-precision, and double-precision floating points.
- Signed and unsigned integers.
- Polynomials over {0, 1}.

For all AArch64 floating-point operations, including SIMD operations, the rounding mode and exception trap handling are controlled by the FPCR.

**Note**

AArch32 Advanced SIMD operations always use ARM standard floating-point arithmetic independent of the FPCR and FPSCR rounding mode. In addition, floating-point multiply-addition operations in AArch64 are always performed as fused operations, whereas AArch32 provides both fused and chained variants.

In addition to operations that consume and produce values of the same width and type, the A64 instruction set supports SIMD and scalar operations that produce a wider or narrower vector result:

- Where a SIMD operation narrows a 128-bit vector to a 64-bit vector, the A64 instruction set provides a second-part operation, for example `SHRN2`, that can pack the result of a second operation into the upper part of the same destination register.
- Where a SIMD operation widens a 64-bit vector to a 128-bit vector, the A64 instruction set provides a second-part operation, for example `SMLAL2`, that can extract the source from the upper 64 bits of the source registers.

All SIMD operations that could produce side-effects that are not limited to the destination SIMD and floating-point register, for example a potential update of FPSR.Q or FPSR.IDC, have a dedicated scalar variant to support the use of SIMD with loops requiring specialised head or tail handling, or both.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### C7.2.3 Condition flags and related instructions

The A64 instruction set provides support for flag setting and conditional operations on the SIMD and floating-point register file:

- Floating-point FCSEL and FCCMP instructions are equivalent to the integer CSEL and CCMP instructions.
- Floating-point FCMP. FCMPE, FCCMP, and FCCMP set the PSTATE.{N, Z, C, V} flags based on the result of the floating-point comparison.
- Floating-point and integer instructions provide a means of producing either a scalar or a vector mask based on a comparison in a SIMD and floating-point register, for example FCMEQ.

**Note**

FCMP and FCMPE differ from the A32/T32 VCMP and VCMPE instructions, which use the dedicated FPSCR.NZCV field for the result. A64 instructions store the result of an FCMP or FCMPE operation in the PSTATE.{N, Z, C, V} field.

### C7.2.4 General capabilities

A64 SIMD and floating-point instructions provide the following capabilities:

- General arithmetic on vector and scalar floating-point and integer values.
- Dedicated polynomial multiply over {0, 1}.
- Vector and scalar fused multiply-addition of single-precision and double-precision floating-points.
- Load and store of single and pairs of SIMD and floating-point registers.
- Load and store of structures and individual lanes of between one and four SIMD and floating-point registers.
- Direct conversion between 64-bit integers and floating-point values, with explicit rounding.
- Double-rounding free conversion between double-precision and half-precision floating-point values.
- Comprehensive SIMD with widening and narrowing support.
- Vector to scalar reduction returning the minimum or maximum value, or the sum.
- Floating-point to nearest integer in floating-point format.

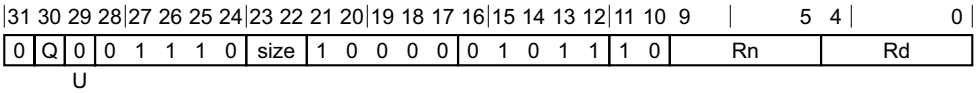
## C7.3.1 ABS

Absolute value (vector)

### Scalar

#### *Scalar variant*

```
ABS <V><d>, <V><n>
```



#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size != '11' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;

boolean neg = (U == '1');
```

### Vector

#### *Vector variant*

```
ABS <Vd>.<T>, <Vn>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '110' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean neg = (U == '1');
```

### Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

`D` when `size = 11`

The following encodings are reserved:

- `size = 0x`.
- `size = 10`.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0

16B when size = 00, Q = 1

4H when size = 01, Q = 0

8H when size = 01, Q = 1

2S when size = 10, Q = 0

4S when size = 10, Q = 1

2D when size = 11, Q = 1

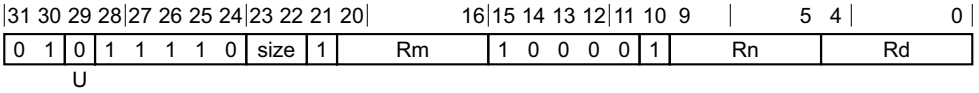
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
integer element;

for e = 0 to elements-1
    element = SInt(Elem[operand, e, esize]);
    if neg then
        element = -element;
    else
        element = Abs(element);
    Elem[result, e, esize] = element<esize-1:0>;



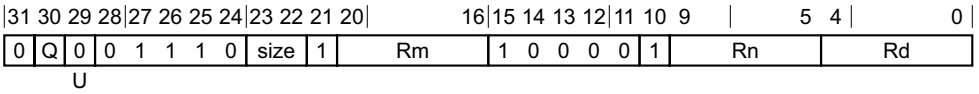
V[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C7.3.2 ADD (vector)

Add (vector)

### Scalar



#### *Scalar variant*

```
ADD <V><d>, <V><n>, <V><m>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size != '11' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean sub_op = (U == '1');
```

### Vector

#### *Vector variant*

```
ADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean sub_op = (U == '1');
```

### Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

D when `size = 11`

The following encodings are reserved:

- `size = 0x`.
- `size = 10`.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0

16B when size = 00, Q = 1

4H when size = 01, Q = 0

8H when size = 01, Q = 1

2S when size = 10, Q = 0

4S when size = 10, Q = 1

2D when size = 11, Q = 1

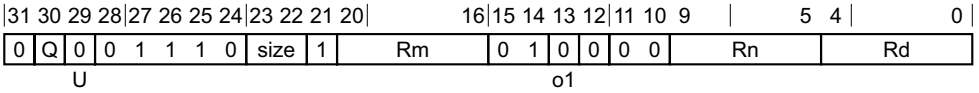
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;



for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    if sub_op then
        Elem[result, e, esize] = element1 - element2;
    else
        Elem[result, e, esize] = element1 + element2;

V[d] = result;
```

Non-Confidential - Beta

## C7.3.3 ADDHN, ADDHN2

Add returning high narrow

### *Three registers, not all the same type variant*

```
ADDHN{2} <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean round = (U == '1');
```

### Assembler symbols

2 — Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> — Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vn> — Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Ta> — Is an arrangement specifier, encoded in the "size" field. It can have the following values:

- 8H when size = 00
- 4S when size = 01
- 2D when size = 10

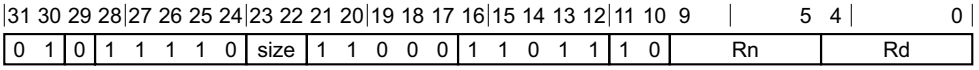
The encoding size = 11 is reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n];
bits(2*datasize) operand2 = V[m];
bits(datasize)   result;
integer round_const = if round then 1 << (esize - 1) else 0;
bits(2*esize) element1;
bits(2*esize) element2;
bits(2*esize) sum;



for e = 0 to elements-1
    element1 = Elem[operand1, e, 2*esize];
    element2 = Elem[operand2, e, 2*esize];
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    sum = sum + round_const;
    Elem[result, e, esize] = sum<2*esize-1:esize>;

Vpart[d, part] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C7.3.4 ADDP (scalar)

Add pair of elements (scalar)

### *Advanced SIMD variant*

```
ADDP <V><d>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size != '11' then ReservedValue();

integer esize = 8 << UInt(size);
integer datasize = esize * 2;
integer elements = 2;

ReduceOp op = ReduceOp_ADD;
```

### Assembler symbols

<V> Is the destination width specifier, encoded in the "size" field. It can have the following values:

D when size = 11

The following encodings are reserved:

- size = 0x.
- size = 10.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

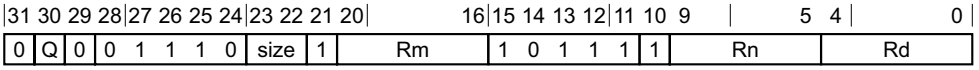
<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is the source arrangement specifier, encoded in the "size" field. It can have the following values:

2D when size = 11

The following encodings are reserved:

- size = 0x.
- size = 10.



### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(op, operand, esize);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C7.3.5 ADDP (vector)

Add pairwise (vector)

### *Three registers of the same type variant*

```
ADDP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1
- 2D when size = 11, Q = 1

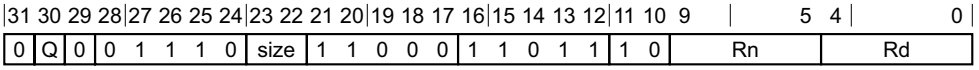
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
bits(esize) element1;
bits(esize) element2;



for e = 0 to elements-1
    element1 = Elem[concat, 2*e, esize];
    element2 = Elem[concat, (2*e)+1, esize];
    Elem[result, e, esize] = element1 + element2;

V[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C7.3.6 ADDV

Add across vector

### *Advanced SIMD variant*

```
ADDV <V><d>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '100' then ReservedValue();
if size == '11' then ReservedValue();

integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

ReduceOp op = ReduceOp_ADD;
```

## Assembler symbols

<V> Is the destination width specifier, encoded in the "size" field. It can have the following values:

- B when size = 00
- H when size = 01
- S when size = 10

The encoding size = 11 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

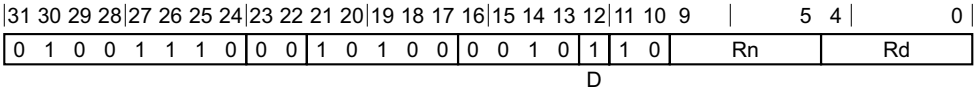
<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 4S when size = 10, Q = 1

The following encodings are reserved:

- size = 10, Q = 0.
- size = 11, Q = x.



## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(op, operand, esize);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C7.3.7 AESD

AES single round decryption

### *Advanced SIMD variant*

```
AESD <Vd>.16B, <Vn>.16B
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
if ! HaveCryptoExt() then UnallocatedEncoding();
boolean decrypt = (D == '1');
```

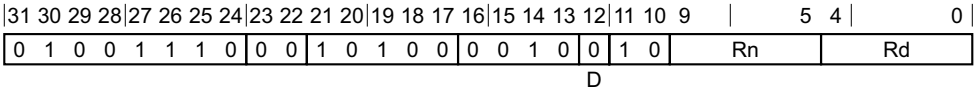
### Assembler symbols

<Vd> Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.

<Vn> Is the name of the second SIMD&FP source register, encoded in the "Rn" field.

### Operation

```
CheckCryptoEnabled64();



bits(128) operand1 = V[d];
bits(128) operand2 = V[n];
bits(128) result;
result = operand1 EOR operand2;
if decrypt then
    result = AESInvSubBytes(AESInvShiftRows(result));
else
    result = AESSubBytes(AESShiftRows(result));

V[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C7.3.8 AESE

AES single round encryption

### *Advanced SIMD variant*

```
AESE <Vd>.16B, <Vn>.16B
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
if ! HaveCryptoExt() then UnallocatedEncoding();
boolean decrypt = (D == '1');
```

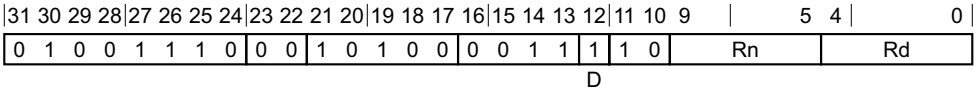
### Assembler symbols

<Vd> Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.

<Vn> Is the name of the second SIMD&FP source register, encoded in the "Rn" field.

### Operation

```
CheckCryptoEnabled64();



bits(128) operand1 = V[d];
bits(128) operand2 = V[n];
bits(128) result;
result = operand1 EOR operand2;
if decrypt then
    result = AESInvSubBytes(AESInvShiftRows(result));
else
    result = AESSubBytes(AESShiftRows(result));

V[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C7.3.9 AESIMC

AES inverse mix columns

### *Advanced SIMD variant*

```
AESIMC <Vd>.16B, <Vn>.16B
```

### *Decode for this encoding*

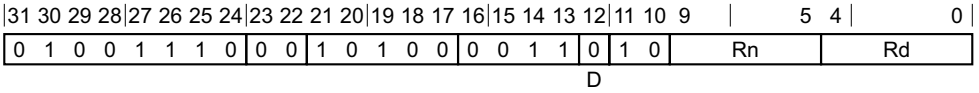
```
integer d = UInt(Rd);
integer n = UInt(Rn);
if ! HaveCryptoExt() then UnallocatedEncoding();
boolean decrypt = (D == '1');
```

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

### Operation



```
CheckCryptoEnabled64();

bits(128) operand = V[n];

## C7.3.10 AESMC

AES mix columns

### *Advanced SIMD variant*

```
AESMC <Vd>.16B, <Vn>.16B
```

### *Decode for this encoding*

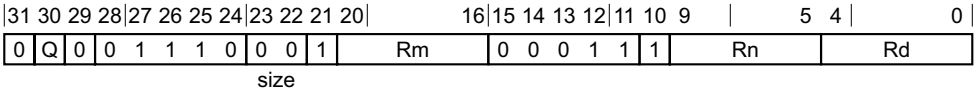
```
integer d = UInt(Rd);
integer n = UInt(Rn);
if ! HaveCryptoExt() then UnallocatedEncoding();
boolean decrypt = (D == '1');
```

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

### Operation



```
CheckCryptoEnabled64();

bits(128) operand = V[n];
bits(128) result;
if decrypt then
    result = AESInvMixColumns(operand);
else
    result = AESMixColumns(operand);
V[d] = result;
```

## C7.3.11 AND (vector)

Bitwise AND (vector)

### *Three registers of the same type variant*

```
AND <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean invert = (size<0> == '1');
LogicalOp op = if size<1> == '1' then LogicalOp_ORR else LogicalOp_AND;
```

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:

8B when Q = 0

16B when Q = 1

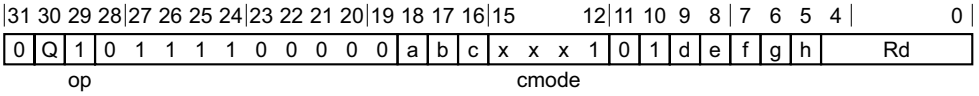
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

if invert then operand2 = NOT(operand2);



case op of
    when LogicalOp_AND
        result = operand1 AND operand2;
    when LogicalOp_ORR
        result = operand1 OR operand2;

V[d] = result;
```

## C7.3.12 BIC (vector, immediate)

Bitwise bit clear (vector, immediate)

### *16-bit variant*

Applies when `cmode = 10x1`.

```
BIC <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

### *32-bit variant*

Applies when `cmode = 0xx1`.

```
BIC <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

### *Decode for all variants of this encoding*

```
integer rd = UInt(Rd);

integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;
bits(64) imm64;

ImmediateOp operation;
case cmode:op of
    when '0xx00' operation = ImmediateOp_MOVI;
    when '0xx01' operation = ImmediateOp_MVNI;
    when '0xx10' operation = ImmediateOp_ORR;
    when '0xx11' operation = ImmediateOp_BIC;
    when '10x00' operation = ImmediateOp_MOVI;
    when '10x01' operation = ImmediateOp_MVNI;
    when '10x10' operation = ImmediateOp_ORR;
    when '10x11' operation = ImmediateOp_BIC;
    when '110x0' operation = ImmediateOp_MOVI;
    when '110x1' operation = ImmediateOp_MVNI;
    when '1110x' operation = ImmediateOp_MOVI;
    when '11110' operation = ImmediateOp_MOVI;
    when '11111'
        // FMOV Dn,#imm is in main FP instruction set
        if Q == '0' then UnallocatedEncoding();
        operation = ImmediateOp_MOVI;

imm64 = AdvSIMDExpandImm(op, cmode, a:b:c:d:e:f:g:h);
imm = Replicate(imm64, datasize DIV 64);
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP register, encoded in the "Rd" field.

<T> For the 16-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

- 4H when `Q = 0`
- 8H when `Q = 1`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For the 32-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

2S when Q = 0

4S when Q = 1

<imm8> Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".

<amount> For the 16-bit variant: is the shift amount encoded in the "cmode<1>" field. It can have the following values:

0 when cmode<1> = 0

8 when cmode<1> = 1

defaulting to 0 if LSL is omitted.

For the 32-bit variant: is the shift amount encoded in the "cmode<2:1>" field. It can have the following values:

0 when cmode<2:1> = 00

8 when cmode<2:1> = 01

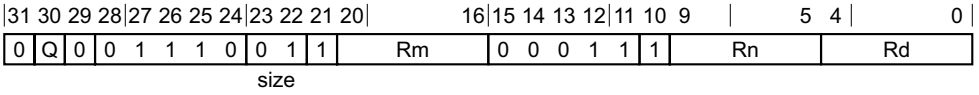
16 when cmode<2:1> = 10

24 when cmode<2:1> = 11

defaulting to 0 if LSL is omitted.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand;
bits(datasize) result;



case operation of
    when ImmediateOp_MOVI
        result = imm;
    when ImmediateOp_MVNI
        result = NOT(imm);
    when ImmediateOp_ORR
        operand = V[rd];
        result = operand OR imm;
    when ImmediateOp_BIC
        operand = V[rd];
        result = operand AND NOT(imm);

V[rd] = result;

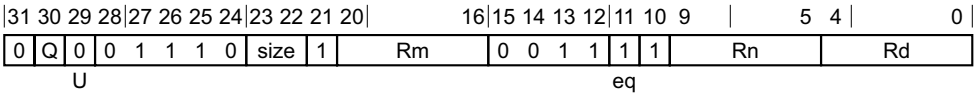
## C7.3.21 CMGE (register)

Compare signed greater than or equal (vector)

### Scalar



#### *Scalar variant*

```
CMGE <V><d>, <V><n>, <V><m>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size != '11' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
boolean cmp_eq = (eq == '1');
```

### Vector

#### *Vector variant*

```
CMGE <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
boolean cmp_eq = (eq == '1');
```

### Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

D when `size = 11`

The following encodings are reserved:

- `size = 0x`.
- `size = 10`.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0

16B when size = 00, Q = 1

4H when size = 01, Q = 0

8H when size = 01, Q = 1

2S when size = 10, Q = 0

4S when size = 10, Q = 1

2D when size = 11, Q = 1

The encoding size = 11, Q = 0 is reserved.

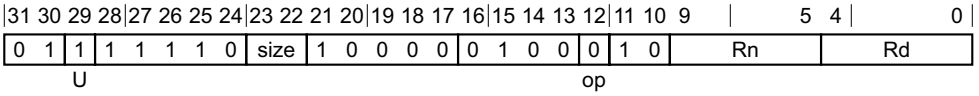
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
boolean test_passed;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    test_passed = if cmp_eq then element1 >= element2 else element1 > element2;
    Elem[result, e, esize] = if test_passed then Ones() else Zeros();



V[d] = result;
```

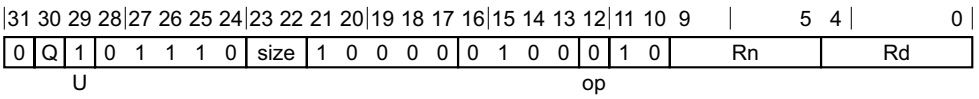
## C7.3.22 CMGE (zero)

Compare signed greater than or equal to zero (vector) , setting destination vector element to all ones if the condition holds, else zero

### Scalar

#### *Scalar variant*

```
CMGE <V><d>, <V><n>, #0
```



#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size != '11' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;

CompareOp comparison;
case op:U of
    when '00' comparison = CompareOp_GT;
    when '01' comparison = CompareOp_GE;
    when '10' comparison = CompareOp_EQ;
    when '11' comparison = CompareOp_LE;
```

### Vector

#### *Vector variant*

```
CMGE <Vd>.<T>, <Vn>.<T>, #0
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '110' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

CompareOp comparison;
case op:U of
    when '00' comparison = CompareOp_GT;
    when '01' comparison = CompareOp_GE;
    when '10' comparison = CompareOp_EQ;
    when '11' comparison = CompareOp_LE;
```

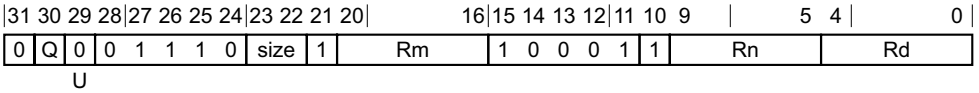
## C7.3.29 CMTST

Compare bitwise test bits nonzero (vector) , setting destination vector element to all ones if the condition holds, else zero

### Scalar



#### *Scalar variant*

```
CMTST <V><d>, <V><n>, <V><m>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size != '11' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean and_test = (U == '0');
```

### Vector

#### *Vector variant*

```
CMTST <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean and_test = (U == '0');
```

### Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

`D` when `size = 11`

The following encodings are reserved:

- `size = 0x`.
- `size = 10`.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0

16B when size = 00, Q = 1

4H when size = 01, Q = 0

8H when size = 01, Q = 1

2S when size = 10, Q = 0

4S when size = 10, Q = 1

2D when size = 11, Q = 1

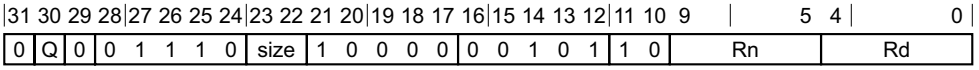
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
boolean test_passed;



for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    if and_test then
        test_passed = !IsZero(element1 AND element2);
    else
        test_passed = (element1 == element2);
    Elem[result, e, esize] = if test_passed then Ones() else Zeros();

V[d] = result;
```

## C7.3.30 CNT

Population count per byte

### *Vector variant*

```
CNT <Vd>.<T>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size != '00' then ReservedValue();
integer esize = 8;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 8;
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0

16B when size = 00, Q = 1

The following encodings are reserved:

- size = 01, Q = x.
- size = 1x, Q = x.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

integer count;
for e = 0 to elements-1
    count = BitCount(Elem[operand, e, esize]);
    Elem[result, e, esize] = count<esize-1:0>;
V[d] = result;
```

## C7.3.31 DUP (element)

Duplicate vector element to vector or scalar

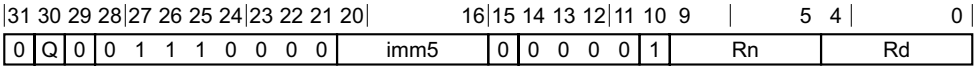
This instruction is used by the alias MOV (scalar). The alias is always the preferred disassembly.

### Scalar

#### *Scalar variant*

```
DUP <V><d>, <Vn>.<T>[<index>]
```

#### *Decode for this encoding*



```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);
if size > 3 then UnallocatedEncoding();

integer index = UInt(imm5<4:size+1>);
integer idxdsize = if imm5<4> == '1' then 128 else 64;

integer esize = 8 << size;
integer datasize = esize;
integer elements = 1;
```

### Vector

#### *Vector variant*

```
DUP <Vd>.<T>, <Vn>.<Ts>[<index>]
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);
if size > 3 then UnallocatedEncoding();

integer index = UInt(imm5<4:size+1>);
integer idxdsize = if imm5<4> == '1' then 128 else 64;

if size == 3 && Q == '0' then ReservedValue();
integer esize = 8 << size;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

### Assembler symbols

<T> For the scalar variant: is the element width specifier, encoded in the "imm5" field. It can have the following values:

B when imm5 = xxxx1

H when imm5 = xxx10

S when imm5 = xx100

D when imm5 = x1000

The encoding imm5 = x0000 is reserved.

For the vector variant: is an arrangement specifier, encoded in the "imm5:Q" field. It can have the following values:

8B when imm5 = xxxx1, Q = 0

16B when imm5 = xxxx1, Q = 1

4H when imm5 = xxx10, Q = 0

8H when imm5 = xxx10, Q = 1

2S when imm5 = xx100, Q = 0

4S when imm5 = xx100, Q = 1

2D when imm5 = x1000, Q = 1

The following encodings are reserved:

- imm5 = x0000, Q = x.
- imm5 = x1000, Q = 0.

<Ts> Is an element size specifier, encoded in the "imm5" field. It can have the following values:

B when imm5 = xxxx1

H when imm5 = xxx10

S when imm5 = xx100

D when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<V> Is the destination width specifier, encoded in the "imm5" field. It can have the following values:

B when imm5 = xxxx1

H when imm5 = xxx10

S when imm5 = xx100

D when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<index> Is the element index encoded in the "imm5" field. It can have the following values:

imm5<4:1> when imm5 = xxxx1

imm5<4:2> when imm5 = xxx10

imm5<4:3> when imm5 = xx100

imm5<4> when imm5 = x1000

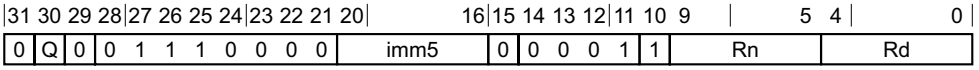
The encoding imm5 = x0000 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Operation for all encodings



```
CheckFPAdvSIMDEnabled64();
bits(idxdsize) operand = V[n];
bits(datasize) result;
bits(esize) element;

element = Elem[operand, index, esize];
for e = 0 to elements-1
    Elem[result, e, esize] = element;
V[d] = result;
```

## C7.3.32 DUP (general)

Duplicate general-purpose register to vector

### *Advanced SIMD variant*

```
DUP <Vd>.<T>, <R><n>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);
if size > 3 then UnallocatedEncoding();

// imm5<4:size+1> is IGNORED

if size == 3 && Q == '0' then ReservedValue();
integer esize = 8 << size;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "imm5:Q" field. It can have the following values:

8B when `imm5 = xxxx1, Q = 0`

16B when `imm5 = xxxx1, Q = 1`

4H when `imm5 = xxx10, Q = 0`

8H when `imm5 = xxx10, Q = 1`

2S when `imm5 = xx100, Q = 0`

4S when `imm5 = xx100, Q = 1`

2D when `imm5 = x1000, Q = 1`

The following encodings are reserved:

- `imm5 = x0000, Q = x`.
- `imm5 = x1000, Q = 0`.

<R> Is the width specifier for the general-purpose source register, encoded in the "imm5" field. It can have the following values:

W when `imm5 = xxxx1`

W when `imm5 = xxx10`

W when `imm5 = xx100`

X when `imm5 = x1000`

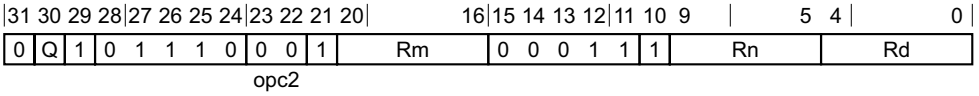
The encoding `imm5 = x0000` is reserved.

Unspecified bits in "imm5" are ignored but should be set to zero by an assembler.

<n> Is the number [0-30] of the general-purpose source register or ZR (31), encoded in the "Rn" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Operation



```
CheckFPAdvSIMDEnabled64();
bits(esize) element = X[n];
bits(datasize) result;

for e = 0 to elements-1
    Elem[result, e, esize] = element;
V[d] = result;
```

## C7.3.33 EOR (vector)

Bitwise exclusive OR (vector)

### *Three registers of the same type variant*

```
EOR <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

VBitOp op;

case opc2 of
    when '00' op = VBitOp_VEOR;
    when '01' op = VBitOp_VBSL;
    when '10' op = VBitOp_VBIT;
    when '11' op = VBitOp_VBIF;
```

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:

8B when Q = 0

16B when Q = 1

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1;
bits(datasize) operand2;
bits(datasize) operand3;
bits(datasize) operand4 = V[n];

case op of
    when VBitOp_VEOR
        operand1 = V[m];
        operand2 = Zeros();
        operand3 = Ones();
    when VBitOp_VBSL
        operand1 = V[m];
        operand2 = operand1;
        operand3 = V[d];
    when VBitOp_VBIT
        operand1 = V[d];
```

## C7.3.34 EXT

Extract vector from pair of vectors

### *Advanced SIMD variant*

```
EXT <Vd>.<T>, <Vn>.<T>, <Vm>.<T>, #<index>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if Q == '0' && imm4<3> == '1' then UnallocatedEncoding();

integer datasize = if Q == '1' then 128 else 64;
integer position = UInt(imm4) << 3;
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:

- 8B when Q = 0
- 16B when Q = 1

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

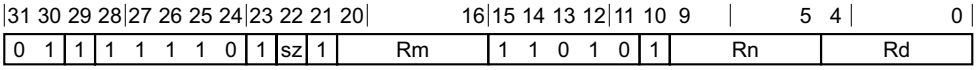
<index> Is the lowest numbered byte element to be extracted, encoded in the "Q:imm4" field. It can have the following values:

- imm4<2:0> when Q = 0, imm4<3> = 0
- imm4 when Q = 1, imm4<3> = x

The encoding Q = 0, imm4<3> = 1 is reserved.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) hi = V[m];
bits(datasize) lo = V[n];
bits(datasize*2) concat = hi : lo;



V[d] = concat<position+datasize-1:position>;
```

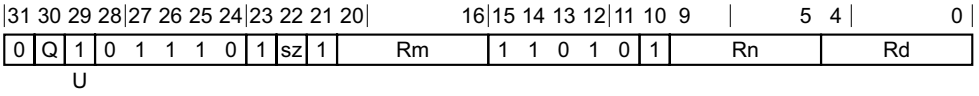
## C7.3.35 FABD

Floating-point absolute difference (vector)

### Scalar



#### *Scalar variant*

```
FABD <V><d>, <V><n>, <V><m>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;
boolean abs = TRUE;
```

### Vector

#### *Vector variant*

```
FABD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean abs = (U == '1');
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

4S when sz = 0, Q = 1

2D when sz = 1, Q = 1

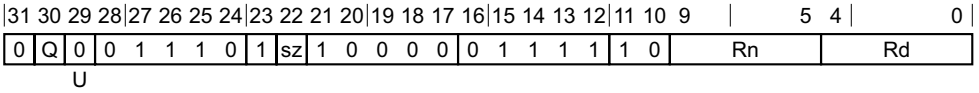
The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
bits(esize) diff;



for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    diff = FPSub(element1, element2, FPCR);
    Elem[result, e, esize] = if abs then FPAbs(diff) else diff;

V[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C7.3.36 FABS (vector)

Floating-point absolute value (vector)

### *Vector variant*

```
FABS <Vd>.<T>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean neg = (U == '1');
```

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when `sz = 0, Q = 0`

4S when `sz = 0, Q = 1`

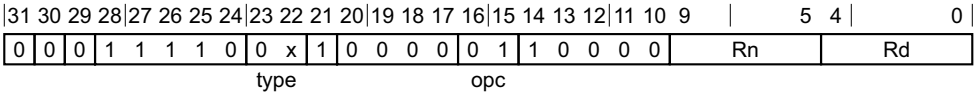
2D when `sz = 1, Q = 1`

The encoding `sz = 1, Q = 0` is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1
    element = Elem[operand, e, esize];
    if neg then
        element = FPNeg(element);
    else
        element = FPAbs(element);
    Elem[result, e, esize] = element;

V[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C7.3.37 FABS (scalar)

Floating-point absolute value (scalar) : `Vd = abs(Vn)`

### *Single-precision variant*

Applies when `type = 00`.

```
FABS <Sd>, <Sn>
```

### *Double-precision variant*

Applies when `type = 01`.

```
FABS <Dd>, <Dn>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

FPUnaryOp fpop;
case opc of
    when '00' fpop = FPUnaryOp_MOV;
    when '01' fpop = FPUnaryOp_ABS;
    when '10' fpop = FPUnaryOp_NEG;
    when '11' fpop = FPUnaryOp_SQRT;
```

## Assembler symbols

| | |
|---|---|
| <Dd> | Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |
| <Dn> | Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field. |
| <Sd> | Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |
| <Sn> | Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field. |

## Operation

```
CheckFPAdvSIMDEnabled64();

bits(datasize) result;
bits(datasize) operand = V[n];

case fpop of
    when FPUnaryOp_MOV  result = operand;

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

4S when sz = 0, Q = 1

2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

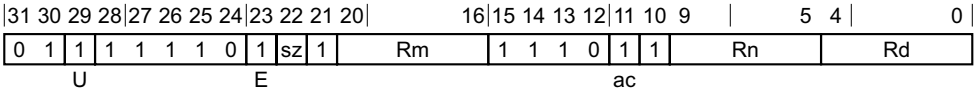
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

### Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
boolean test_passed;

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    if abs then
        element1 = FPAbs(element1);
        element2 = FPAbs(element2);
    case cmp of
        when CompareOp_EQ test_passed = FPCompareEQ(element1, element2, FPCR);
        when CompareOp_GE test_passed = FPCompareGE(element1, element2, FPCR);
        when CompareOp_GT test_passed = FPCompareGT(element1, element2, FPCR);
    Elem[result, e, esize] = if test_passed then Ones() else Zeros();



V[d] = result;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

4S when sz = 0, Q = 1

2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

### Operation for all encodings

```
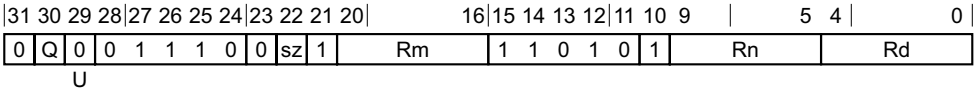
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
boolean test_passed;



for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    if abs then
        element1 = FPAbs(element1);
        element2 = FPAbs(element2);
    case cmp of
        when CompareOp_EQ test_passed = FPCompareEQ(element1, element2, FPCR);
        when CompareOp_GE test_passed = FPCompareGE(element1, element2, FPCR);
        when CompareOp_GT test_passed = FPCompareGT(element1, element2, FPCR);
    Elem[result, e, esize] = if test_passed then Ones() else Zeros();

V[d] = result;

## C7.3.40 FADD (vector)

Floating-point add (vector)

### *Three registers of the same type variant*

```
FADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean pair = (U == '1');
```

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

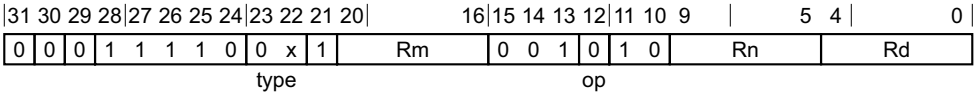
The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
bits(esize) element1;
bits(esize) element2;



for e = 0 to elements-1
    if pair then
        element1 = Elem[concat, 2*e, esize];
        element2 = Elem[concat, (2*e)+1, esize];
    else
        element1 = Elem[operand1, e, esize];
        element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPAdd(element1, element2, FPCR);

V[d] = result;

## C7.3.41 FADD (scalar)

Floating-point add (scalar) : `Vd = Vn + Vm`

### *Single-precision variant*

Applies when `type = 00`.

```
FADD <Sd>, <Sn>, <Sm>
```

### *Double-precision variant*

Applies when `type = 01`.

```
FADD <Dd>, <Dn>, <Dm>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

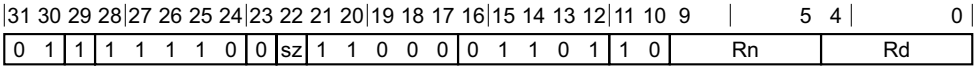
boolean sub_op = (op == '1');
```

## Assembler symbols

| | |
|---|---|
| `<Dd>` | Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |
| `<Dn>` | Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field. |
| `<Dm>` | Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field. |
| `<Sd>` | Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |
| `<Sn>` | Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field. |
| `<Sm>` | Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field. |

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) result;
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];



if sub_op then
    result = FPSub(operand1, operand2, FPCR);
else
    result = FPAdd(operand1, operand2, FPCR);

V[d] = result;
```

## C7.3.42 FADDP (scalar)

Floating-point add pair of elements (scalar)

### *Advanced SIMD variant*

```
FADDP <V><d>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize * 2;
integer elements = 2;

ReduceOp op = ReduceOp_FADD;
```

### Assembler symbols

<V> Is the destination width specifier, encoded in the "sz" field. It can have the following values:

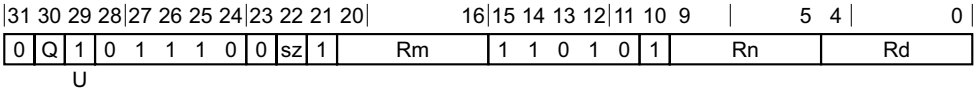
- S when sz = 0
- D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is the source arrangement specifier, encoded in the "sz" field. It can have the following values:

- 2S when sz = 0
- 2D when sz = 1



### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(op, operand, esize);
```

## C7.3.43 FADDP (vector)

Floating-point add pairwise (vector)

### *Three registers of the same type variant*

```
FADDP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean pair = (U == '1');
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

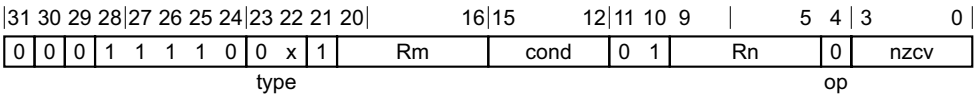
The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
bits(esize) element1;
bits(esize) element2;



for e = 0 to elements-1
    if pair then
        element1 = Elem[concat, 2*e, esize];
        element2 = Elem[concat, (2*e)+1, esize];
    else
        element1 = Elem[operand1, e, esize];
        element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPAdd(element1, element2, FPCR);

V[d] = result;
```

## C7.3.44 FCCMP

Floating-point conditional quiet compare (scalar) , setting condition flags to result of comparison or an immediate value : `flags = if cond then compareQuiet(Vn,Vm) else #nzcv`

### *Single-precision variant*

Applies when `type = 00`.

```
FCCMP <Sn>, <Sm>, #<nzcv>, <cond>
```

### *Double-precision variant*

Applies when `type = 01`.

```
FCCMP <Dn>, <Dm>, #<nzcv>, <cond>
```

### *Decode for all variants of this encoding*

```
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

boolean signal_all_nans = (op == '1');
bits(4) condition = cond;
bits(4) flags = nzcv;
```

## Assembler symbols

| | |
|---|---|
| <Dn> | Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field. |
| <Dm> | Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field. |
| <Sn> | Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field. |
| <Sm> | Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field. |
| <nzcv> | Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field. |
| <cond> | Is one of the standard conditions, encoded in the "cond" field in the standard way. |

## Operation

```
CheckFPAdvSIMDEnabled64();

bits(datasize) operand1 = V[n];
bits(datasize) operand2;

operand2 = V[m];
```

## C7.3.45 FCCMPE

Floating-point conditional signaling compare (scalar) , setting condition flags to result of comparison or an immediate value : `flags = if cond then compareSignaling(Vn,Vm) else #nzcv`

### *Single-precision variant*

Applies when `type = 00`.

```
FCCMPE <Sn>, <Sm>, #<nzcv>, <cond>
```

### *Double-precision variant*

Applies when `type = 01`.

```
FCCMPE <Dn>, <Dm>, #<nzcv>, <cond>
```

### *Decode for all variants of this encoding*

```
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

boolean signal_all_nans = (op == '1');
bits(4) condition = cond;
bits(4) flags = nzcv;
```

## Assembler symbols

| | |
|---|---|
| <Dn> | Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field. |
| <Dm> | Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field. |
| <Sn> | Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field. |
| <Sm> | Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field. |
| <nzcv> | Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field. |

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

4S when sz = 0, Q = 1

2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

### Operation for all encodings

```
CheckFPAdvSIMDEnabled64();

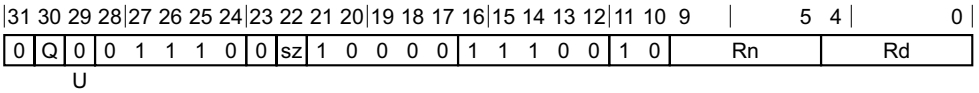
## C7.3.58 FCVTAS (vector)

Floating-point convert to signed integer, rounding to nearest with ties to away (vector)

### Scalar

#### *Scalar variant*

```
FCVTAS <V><d>, <V><n>
```



#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;

FPRounding rounding = FPRounding_TIEAWAY;
boolean unsigned = (U == '1');
```

### Vector

#### *Vector variant*

```
FCVTAS <Vd>.<T>, <Vn>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

FPRounding rounding = FPRounding_TIEAWAY;
boolean unsigned = (U == '1');
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

- S when sz = 0
- D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

4S when sz = 0, Q = 1

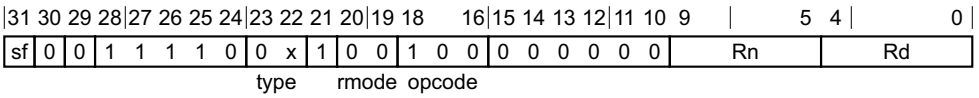
2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, FPCR, rounding);

V[d] = result;
```

## C7.3.62 FCVTL, FCVTL2

Floating-point convert to higher precision long (vector)

### *Vector variant*

```
FCVTL{2} <Vd>.<Ta>, <Vn>.<Tb>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 16 << UInt(sz);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

### Assembler symbols

2 — Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> — Is an arrangement specifier, encoded in the "sz" field. It can have the following values:

- 4S when sz = 0
- 2D when sz = 1

<Vn> — Is the name of the SIMD&FP source register, encoded in the "Rn" field.

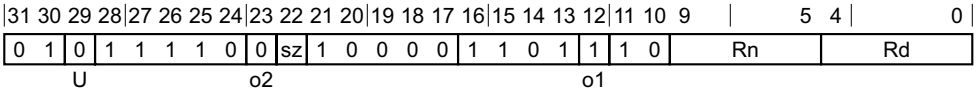
<Tb> — Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 4H when sz = 0, Q = 0
- 8H when sz = 0, Q = 1
- 2S when sz = 1, Q = 0
- 4S when sz = 1, Q = 1

### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = Vpart[n, part];
bits(2*datasize) result;

for e = 0 to elements-1
    Elem[result, e, 2*esize] = FPConvert(Elem[operand, e, esize], FPCR);



V[d] = result;
```

## C7.3.67 FCVTN, FCVTN2

Floating-point convert to lower precision narrow (vector)

### *Vector variant*

```
FCVTN{2} <Vd>.<Tb>, <Vn>.<Ta>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 16 << UInt(sz);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

### Assembler symbols

2 — Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> — Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 4H when sz = 0, Q = 0
- 8H when sz = 0, Q = 1
- 2S when sz = 1, Q = 0
- 4S when sz = 1, Q = 1

<Vn> — Is the name of the SIMD&FP source register, encoded in the "Rn" field.

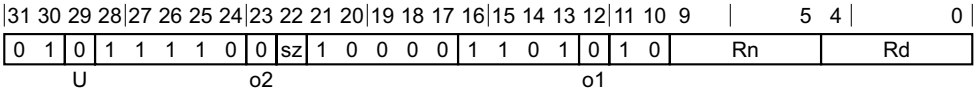
<Ta> — Is an arrangement specifier, encoded in the "sz" field. It can have the following values:

- 4S when sz = 0
- 2D when sz = 1

### Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand = V[n];
bits(datasize) result;

for e = 0 to elements-1
    Elem[result, e, esize] = FPConvert(Elem[operand, e, 2*esize], FPCR);



Vpart[d, part] = result;
```

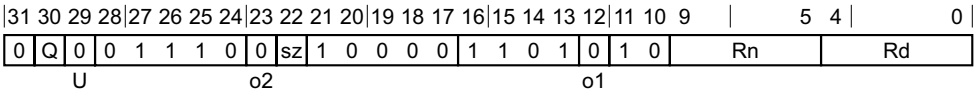
## C7.3.68 FCVTNS (vector)

Floating-point convert to signed integer, rounding to nearest with ties to even (vector)

### Scalar

#### *Scalar variant*

```
FCVTNS <V><d>, <V><n>
```



#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;

FPRounding rounding = FPDecodeRounding(o1:o2);
boolean unsigned = (U == '1');
```

### Vector

#### *Vector variant*

```
FCVTNS <Vd>.<T>, <Vn>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

FPRounding rounding = FPDecodeRounding(o1:o2);
boolean unsigned = (U == '1');
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

- S when sz = 0
- D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

4S when sz = 0, Q = 1

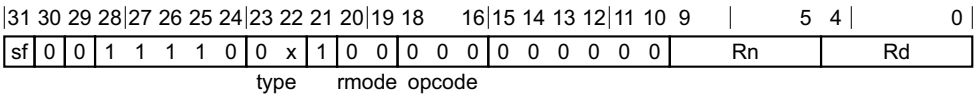
2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, FPCR, rounding);

V[d] = result;

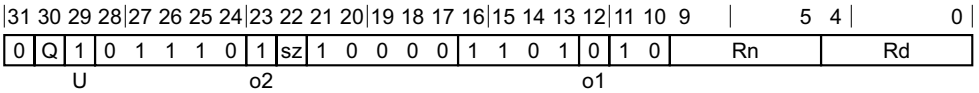
## C7.3.74 FCVTPU (vector)

Floating-point convert to unsigned integer, rounding toward positive infinity (vector)

### Scalar

#### *Scalar variant*

```
FCVTPU <V><d>, <V><n>
```



#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;

FPRounding rounding = FPDecodeRounding(o1:o2);
boolean unsigned = (U == '1');
```

### Vector

#### *Vector variant*

```
FCVTPU <Vd>.<T>, <Vn>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

FPRounding rounding = FPDecodeRounding(o1:o2);
boolean unsigned = (U == '1');
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

- S when sz = 0
- D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

4S when sz = 0, Q = 1

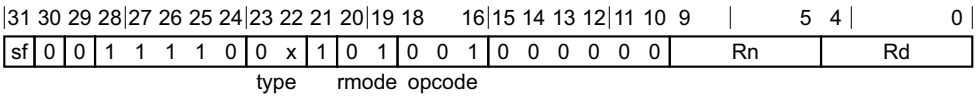
2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, FPCR, rounding);

V[d] = result;
```

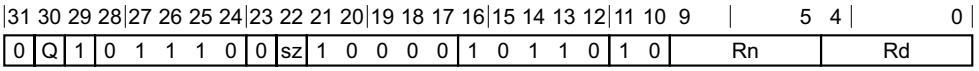
## C7.3.76 FCVTXN, FCVTXN2

Floating-point convert to lower precision narrow, rounding to odd (vector)

### Scalar

#### *Scalar variant*



```
FCVTXN <Vb><d>, <Va><n>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz == '0' then ReservedValue();
integer esize = 32;
integer datasize = esize;
integer elements = 1;
integer part = 0;
```

### Vector

#### *Vector variant*

```
FCVTXN{2} <Vd>.<Tb>, <Vn>.<Ta>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz == '0' then ReservedValue();
integer esize = 32;
integer datasize = 64;
integer elements = 2;
integer part = UInt(Q);
```

### Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0

[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 1, Q = 0

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

4S when sz = 1, Q = 1

The encoding sz = 0, Q = x is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in the "sz" field. It can have the following values:

2D when sz = 1

The encoding sz = 0 is reserved.

<Vb> Is the destination width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 1

The encoding sz = 0 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Va> Is the source width specifier, encoded in the "sz" field. It can have the following values:

D when sz = 1

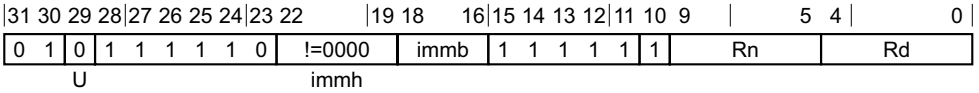
The encoding sz = 0 is reserved.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand = V[n];
bits(datasize) result;

for e = 0 to elements-1
    Elem[result, e, esize] = FPConvert(Elem[operand, e, 2*esize], FPCR, FPRounding_ODD);



Vpart[d, part] = result;
```

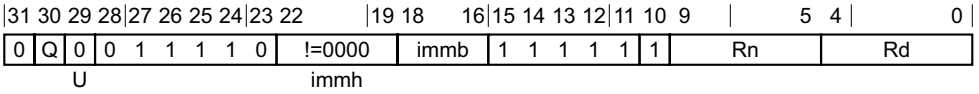
## C7.3.77 FCVTZS (vector, fixed-point)

Floating-point convert to signed fixed-point, rounding toward zero (vector)

### Scalar

#### *Scalar variant*

```
FCVTZS <V><d>, <V><n>, #<fbits>
```



#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '00xx' then ReservedValue();
integer esize = 32 << UInt(immh<3>);
integer datasize = esize;
integer elements = 1;

integer fracbits = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
FPRounding rounding = FPRounding_ZERO;
```

### Vector

#### *Vector variant*

```
FCVTZS <Vd>.<T>, <Vn>.<T>, #<fbits>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh == '00xx' then ReservedValue();
if immh<3>:Q == '10' then ReservedValue();
integer esize = 32 << UInt(immh<3>);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer fracbits = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
FPRounding rounding = FPRounding_ZERO;
```

### Assembler symbols

<V> Is a width specifier, encoded in the "immh" field. It can have the following values:

S when `immh = 01xx`

D when `immh = 1xxx`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The encoding `immh = 00xx` is reserved.

`<d>` Is the number of the SIMD&FP destination register, in the "Rd" field.

`<n>` Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

`<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

`<T>` Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

`2S` when `immh = 01xx`, `Q = 0`

`4S` when `immh = 01xx`, `Q = 1`

`2D` when `immh = 1xxx`, `Q = 1`

See *Advanced SIMD modified immediate* on page C4-231 when `immh = 0000`, `Q = x`.

The following encodings are reserved:

- `immh = 0001`, `Q = x`.
- `immh = 001x`, `Q = x`.
- `immh = 1xxx`, `Q = 0`.

`<Vn>` Is the name of the SIMD&FP source register, encoded in the "Rn" field.

`<fbits>` For the scalar variant: is the number of fractional bits, in the range 1 to the operand width, encoded in the "immh:immb" field. It can have the following values:

`(64-UInt(immh:immb))` when `immh = 01xx`

`(128-UInt(immh:immb))` when `immh = 1xxx`

The encoding `immh = 00xx` is reserved.

For the vector variant: is the number of fractional bits, in the range 1 to the element width, encoded in the "immh:immb" field. It can have the following values:

`(64-UInt(immh:immb))` when `immh = 01xx`

`(128-UInt(immh:immb))` when `immh = 1xxx`

See *Advanced SIMD modified immediate* on page C4-231 when `immh = 0000`.

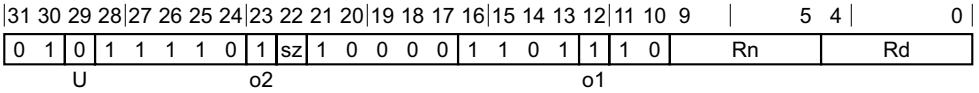
The following encodings are reserved:

- `immh = 0001`.
- `immh = 001x`.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand  = V[n];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, fracbits, unsigned, FPCR, rounding);



V[d] = result;
```

Non-Confidential - Beta

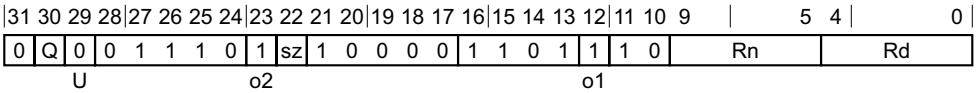
## C7.3.78 FCVTZS (vector, integer)

Floating-point convert to signed integer, rounding toward zero (vector)

### Scalar

#### *Scalar variant*

```
FCVTZS <V><d>, <V><n>
```



#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;

FPRounding rounding = FPDecodeRounding(o1:o2);
boolean unsigned = (U == '1');
```

### Vector

#### *Vector variant*

```
FCVTZS <Vd>.<T>, <Vn>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

FPRounding rounding = FPDecodeRounding(o1:o2);
boolean unsigned = (U == '1');
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

- S when sz = 0
- D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

4S when sz = 0, Q = 1

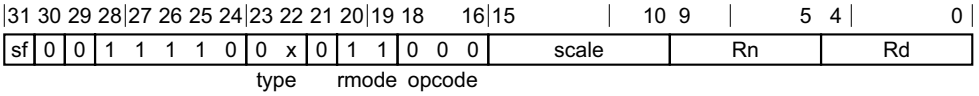
2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, FPCR, rounding);

V[d] = result;
```

integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer fracbits = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
FPRounding rounding = FPRounding_ZERO;
```

### Assembler symbols

<V> Is a width specifier, encoded in the "immh" field. It can have the following values:

S when immh = 01xx

D when immh = 1xxx

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The encoding immh = 00xx is reserved.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

2S when immh = 01xx, Q = 0

4S when immh = 01xx, Q = 1

2D when immh = 1xxx, Q = 1

See *Advanced SIMD modified immediate* on page C4-231 when immh = 0000, Q = x.

The following encodings are reserved:

- immh = 0001, Q = x.
- immh = 001x, Q = x.
- immh = 1xxx, Q = 0.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<fbits> For the scalar variant: is the number of fractional bits, in the range 1 to the operand width, encoded in the "immh:immb" field. It can have the following values:

(64-UInt(immh:immb)) when immh = 01xx

(128-UInt(immh:immb)) when immh = 1xxx

The encoding immh = 00xx is reserved.

For the vector variant: is the number of fractional bits, in the range 1 to the element width, encoded in the "immh:immb" field. It can have the following values:

(64-UInt(immh:immb)) when immh = 01xx

(128-UInt(immh:immb)) when immh = 1xxx

See *Advanced SIMD modified immediate* on page C4-231 when immh = 0000.

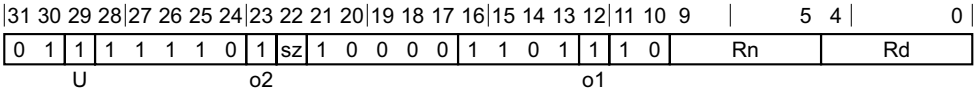
The following encodings are reserved:

- immh = 0001.
- immh = 001x.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand  = V[n];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, fracbits, unsigned, FPCR, rounding);



V[d] = result;
```

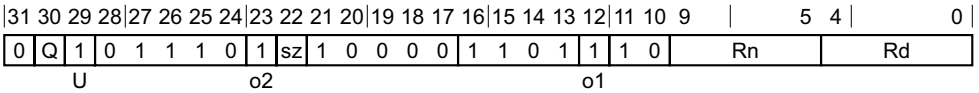
## C7.3.82 FCVTZU (vector, integer)

Floating-point convert to unsigned integer, rounding toward zero (vector)

### Scalar

#### *Scalar variant*

```
FCVTZU <V><d>, <V><n>
```



#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;

FPRounding rounding = FPDecodeRounding(o1:o2);
boolean unsigned = (U == '1');
```

### Vector

#### *Vector variant*

```
FCVTZU <Vd>.<T>, <Vn>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

FPRounding rounding = FPDecodeRounding(o1:o2);
boolean unsigned = (U == '1');
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

- S when sz = 0
- D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

4S when sz = 0, Q = 1

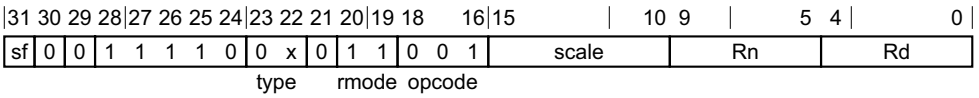
2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, FPCR, rounding);

V[d] = result;
```

## C7.3.83 FCVTZU (scalar, fixed-point)

Floating-point convert to unsigned fixed-point, rounding toward zero (scalar) : `Rd = unsigned_convertToIntegerExactTowardZero(Vn*(2^fbits))`

### *Single-precision to 32-bit variant*

Applies when `sf = 0 && type = 00`.

```
FCVTZU <Wd>, <Sn>, #<fbits>
```

### *Single-precision to 64-bit variant*

Applies when `sf = 1 && type = 00`.

```
FCVTZU <Xd>, <Sn>, #<fbits>
```

### *Double-precision to 32-bit variant*

Applies when `sf = 0 && type = 01`.

```
FCVTZU <Wd>, <Dn>, #<fbits>
```

### *Double-precision to 64-bit variant*

Applies when `sf = 1 && type = 01`.

```
FCVTZU <Xd>, <Dn>, #<fbits>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer intsize = if sf == '1' then 64 else 32;
integer fltsize;
FPConvOp op;
FPRounding rounding;
boolean unsigned;

case type of
    when '00' fltsize = 32;
    when '01' fltsize = 64;
    when '1x' UnallocatedEncoding();

if sf == '0' && scale<5> == '0' then UnallocatedEncoding();
integer fracbits = 64 - UInt(scale);

case opcode<2:1>:rmode of
    when '00 11'        // FCVTZ
        rounding = FPRounding_ZERO;
        unsigned = (opcode<0> == '1');
        op = FPConvOp_CVT_FtoI;
    when '01 00'        // [US]CVTF
        rounding = FPRoundingMode(FPCR);
        unsigned = (opcode<0> == '1');
        op = FPConvOp_CVT_ItoF;
    otherwise
        UnallocatedEncoding();
```

## C7.3.85 FDIV (vector)

Floating-point divide (vector)

### *Three registers of the same type variant*

```
FDIV <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

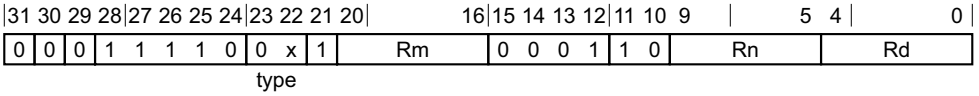
The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;



for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPDiv(element1, element2, FPCR);

V[d] = result;
```

## C7.3.91 FMAXNM (scalar)

Floating-point maximum number (scalar) : `Vd = maxNum(Vn, Vm)`

### *Single-precision variant*

Applies when `type = 00`.

```
FMAXNM <Sd>, <Sn>, <Sm>
```

### *Double-precision variant*

Applies when `type = 01`.

```
FMAXNM <Dd>, <Dn>, <Dm>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

FPMaxMinOp operation;
case op of
    when '00' operation = FPMaxMinOp_MAX;
    when '01' operation = FPMaxMinOp_MIN;
    when '10' operation = FPMaxMinOp_MAXNUM;
    when '11' operation = FPMaxMinOp_MINNUM;
```

## Assembler symbols

| | |
|---|---|
| <Dd> | Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |
| <Dn> | Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field. |
| <Dm> | Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field. |
| <Sd> | Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |
| <Sn> | Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field. |
| <Sm> | Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field. |

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) result;
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];

case operation of

## C7.3.92 FMAXNMP (scalar)

Floating-point maximum number of pair of elements (scalar)

### *Advanced SIMD variant*

```
FMAXNMP <V><d>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize * 2;
integer elements = 2;

ReduceOp op = if o1 == '1' then ReduceOp_FMINNUM else ReduceOp_FMAXNUM;
```

### Assembler symbols

<V> Is the destination width specifier, encoded in the "sz" field. It can have the following values:

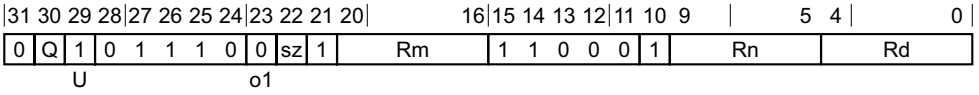
- S when sz = 0
- D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is the source arrangement specifier, encoded in the "sz" field. It can have the following values:

- 2S when sz = 0
- 2D when sz = 1



### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(op, operand, esize);
```

## C7.3.93 FMAXNMP (vector)

Floating-point maximum number pairwise (vector)

### *Three registers of the same type variant*

```
FMAXNMP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean pair = (U == '1');
boolean minimum = (o1 == '1');
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1

## C7.3.94 FMAXNMV

Floating-point maximum number across vector

### *Advanced SIMD variant*

```
FMAXNMV <V><d>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q != '01' then ReservedValue();   // .4S only

integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

ReduceOp op = if o1 == '1' then ReduceOp_FMINNUM else ReduceOp_FMAXNUM;
```

## Assembler symbols

<V> Is the destination width specifier, encoded in the "sz" field. It can have the following values:

S when `sz = 0`

The encoding `sz = 1` is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

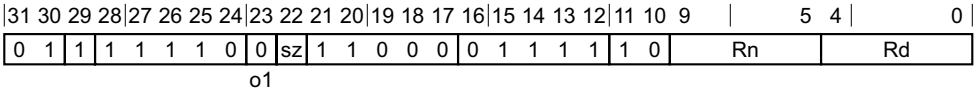
<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:

4S when `Q = 1, sz = 0`

The following encodings are reserved:

- `Q = 0, sz = x`.
- `Q = 1, sz = 1`.



## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(op, operand, esize);
```

## C7.3.95 FMAXP (scalar)

Floating-point maximum of pair of elements (scalar)

### *Advanced SIMD variant*

```
FMAXP <V><d>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize * 2;
integer elements = 2;

ReduceOp op = if o1 == '1' then ReduceOp_FMIN else ReduceOp_FMAX;
```

## Assembler symbols

<V> Is the destination width specifier, encoded in the "sz" field. It can have the following values:

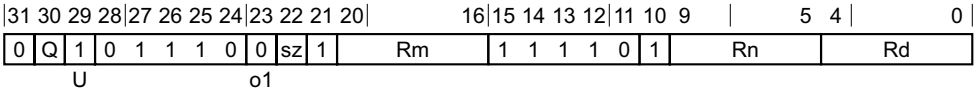
- S when sz = 0
- D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is the source arrangement specifier, encoded in the "sz" field. It can have the following values:

- 2S when sz = 0
- 2D when sz = 1



## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(op, operand, esize);
```

## C7.3.96 FMAXP (vector)

Floating-point maximum pairwise (vector)

### *Three registers of the same type variant*

```
FMAXP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean pair = (U == '1');
boolean minimum = (o1 == '1');
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1

## C7.3.97 FMAXV

Floating-point maximum across vector

### *Advanced SIMD variant*

```
FMAXV <V><d>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q != '01' then ReservedValue();

integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

ReduceOp op = if o1 == '1' then ReduceOp_FMIN else ReduceOp_FMAX;
```

### Assembler symbols

<V> Is the destination width specifier, encoded in the "sz" field. It can have the following values:

S when `sz = 0`

The encoding `sz = 1` is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

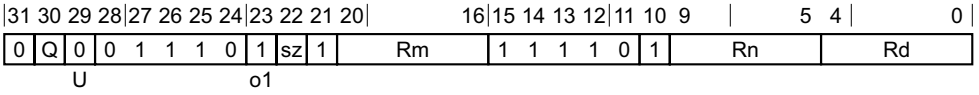
<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:

4S when `Q = 1, sz = 0`

The following encodings are reserved:

- `Q = 0, sz = x`.
- `Q = 1, sz = 1`.



### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];

## C7.3.104 FMINNMV

Floating-point minimum number across vector

### *Advanced SIMD variant*

```
FMINNMV <V><d>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q != '01' then ReservedValue();   // .4S only

integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

ReduceOp op = if o1 == '1' then ReduceOp_FMINNUM else ReduceOp_FMAXNUM;
```

### Assembler symbols

<V> Is the destination width specifier, encoded in the "sz" field. It can have the following values:

S when `sz = 0`

The encoding `sz = 1` is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

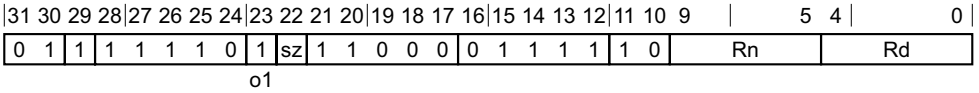
<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:

4S when `Q = 1, sz = 0`

The following encodings are reserved:

- `Q = 0, sz = x`.
- `Q = 1, sz = 1`.



### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(op, operand, esize);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

## C7.3.105 FMINP (scalar)

Floating-point minimum of pair of elements (scalar)

### *Advanced SIMD variant*

```
FMINP <V><d>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize * 2;
integer elements = 2;

ReduceOp op = if o1 == '1' then ReduceOp_FMIN else ReduceOp_FMAX;
```

## Assembler symbols

<V> Is the destination width specifier, encoded in the "sz" field. It can have the following values:

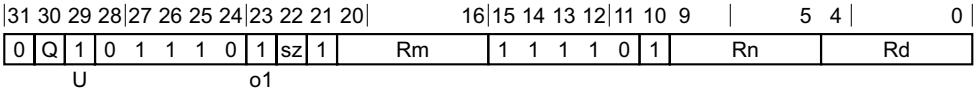
- S when sz = 0
- D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is the source arrangement specifier, encoded in the "sz" field. It can have the following values:

- 2S when sz = 0
- 2D when sz = 1



## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(op, operand, esize);
```

## C7.3.106 FMINP (vector)

Floating-point minimum pairwise (vector)

### *Three registers of the same type variant*

```
FMINP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean pair = (U == '1');
boolean minimum = (o1 == '1');
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1
    if pair then
        element1 = Elem[concat, 2*e, esize];
        element2 = Elem[concat, (2*e)+1, esize];
    else
        element1 = Elem[operand1, e, esize];
        element2 = Elem[operand2, e, esize];

    if minimum then
        Elem[result, e, esize] = FPMin(element1, element2, FPCR);

## C7.3.107 FMINV

Floating-point minimum across vector

### *Advanced SIMD variant*

```
FMINV <V><d>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q != '01' then ReservedValue();

integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

ReduceOp op = if o1 == '1' then ReduceOp_FMIN else ReduceOp_FMAX;
```

### Assembler symbols

<V> Is the destination width specifier, encoded in the "sz" field. It can have the following values:

S when `sz = 0`

The encoding `sz = 1` is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

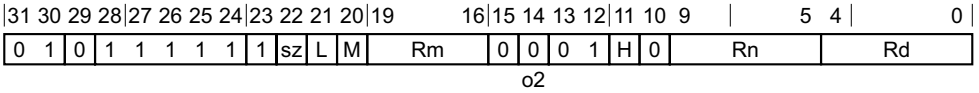
<T> Is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:

4S when `Q = 1, sz = 0`

The following encodings are reserved:

- `Q = 0, sz = x`.
- `Q = 1, sz = 1`.

### Operation



```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(op, operand, esize);
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:

2S when Q = 0, sz = 0

4S when Q = 1, sz = 0

2D when Q = 1, sz = 1

The encoding Q = 0, sz = 1 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> For the scalar variant: is the name of the SIMD&FP source register, encoded in the "M:Rm" fields.

For the vector variant: is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.

<Ts> For the scalar variant: is the element width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

For the vector variant: is an element size specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

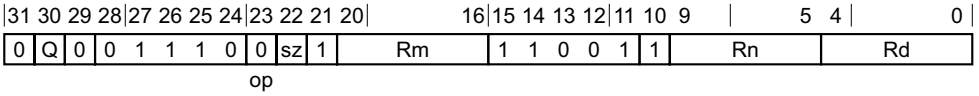
<index> Is the element index, encoded in the "sz:L:H" field. It can have the following values:

H:L when sz = 0, L = x

H when sz = 1, L = 0

The encoding sz = 1, L = 1 is reserved.

### Operation for all encodings



```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(idxdsize) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2 = Elem[operand2, index, esize];

for e = 0 to elements-1

## C7.3.114 FMOV (general)

Floating-point move to or from general-purpose register without conversion

### 32-bit to single-precision variant

Applies when `sf = 0 && type = 00 && rmode = 00 && opcode = 111`.

```
FMOV <Sd>, <Wn>
```

### Single-precision to 32-bit variant

Applies when `sf = 0 && type = 00 && rmode = 00 && opcode = 110`.

```
FMOV <Wd>, <Sn>
```

### 64-bit to double-precision variant

Applies when `sf = 1 && type = 01 && rmode = 00 && opcode = 111`.

```
FMOV <Dd>, <Xn>
```

### 64-bit to top half of 128-bit variant

Applies when `sf = 1 && type = 10 && rmode = 01 && opcode = 111`.

```
FMOV <Vd>.D[1], <Xn>
```

### Double-precision to 64-bit variant

Applies when `sf = 1 && type = 01 && rmode = 00 && opcode = 110`.

```
FMOV <Xd>, <Dn>
```

### Top half of 128-bit to 64-bit variant

Applies when `sf = 1 && type = 10 && rmode = 01 && opcode = 110`.

```
FMOV <Xd>, <Vn>.D[1]
```

### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer intsize = if sf == '1' then 64 else 32;

## C7.3.115 FMOV (scalar, immediate)

Floating-point move immediate (scalar) : `Vd=#imm`

### *Single-precision variant*

Applies when `type = 00`.

```
FMOV <Sd>, #<imm>
```

### *Double-precision variant*

Applies when `type = 01`.

```
FMOV <Dd>, #<imm>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

bits(datasize) imm = VFPExpandImm(imm8);
```

## Assembler symbols

| | |
|---|---|
| `<Dd>` | Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |
| `<Sd>` | Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |
| `<imm>` | Is a signed floating-point constant with 3-bit exponent and normalized 4 bits of precision, encoded in the "imm8" field. |

## Operation

## C7.3.116 FMSUB

Floating-point fused multiply-subtract (scalar) : `Vd = Va + (-Vn)*Vm`

### *Single-precision variant*

Applies when `type = 00`.

```
FMSUB <Sd>, <Sn>, <Sm>, <Sa>
```

### *Double-precision variant*

Applies when `type = 01`.

```
FMSUB <Dd>, <Dn>, <Dm>, <Da>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer a = UInt(Ra);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

boolean opa_neg = (o1 == '1');
boolean op1_neg = (o0 != o1);
```

### Assembler symbols

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.

`<Da>` Is the 64-bit name of the third SIMD&FP source register holding the minuend, encoded in the "Ra" field.

`<Sd>` Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

`<Sn>` Is the 32-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.

`<Sm>` Is the 32-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.

`<Sa>` Is the 32-bit name of the third SIMD&FP source register holding the minuend, encoded in the "Ra" field.

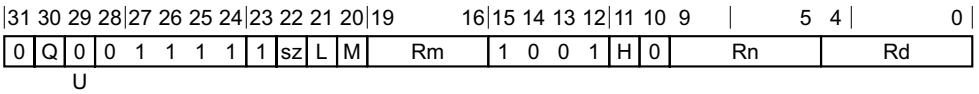
## C7.3.117 FMUL (by element)

Floating-point multiply (by element)

### Scalar

#### *Scalar variant*

```
FMUL <V><d>, <V><n>, <Vm>.<Ts>[<index>]
```



#### *Decode for this encoding*

```
integer idxdsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi = M;
case sz:L of
    when '0x' index = UInt(H:L);
    when '10' index = UInt(H);
    when '11' UnallocatedEncoding();

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;
boolean mulx_op = (U == '1');
```

### Vector

#### *Vector variant*

```
FMUL <Vd>.<T>, <Vn>.<T>, <Vm>.<Ts>[<index>]
```

#### *Decode for this encoding*

```
integer idxdsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi = M;
case sz:L of
    when '0x' index = UInt(H:L);
    when '10' index = UInt(H);
    when '11' UnallocatedEncoding();

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean mulx_op = (U == '1');
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:

2S when Q = 0, sz = 0

4S when Q = 1, sz = 0

2D when Q = 1, sz = 1

The encoding Q = 0, sz = 1 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> For the scalar variant: is the name of the SIMD&FP source register, encoded in the "M:Rm" fields.

For the vector variant: is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.

<Ts> For the scalar variant: is the element width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

For the vector variant: is an element size specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

<index> Is the element index, encoded in the "sz:L:H" field. It can have the following values:

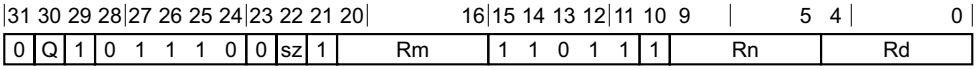
H:L when sz = 0, L = x

H when sz = 1, L = 0

The encoding sz = 1, L = 1 is reserved.

### Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(idxdsize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2 = Elem[operand2, index, esize];



for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    if mulx_op then
        Elem[result, e, esize] = FPMulX(element1, element2, FPCR);
    else
        Elem[result, e, esize] = FPMul(element1, element2, FPCR);

V[d] = result;
```

## C7.3.118 FMUL (vector)

Floating-point multiply (vector)

### *Three registers of the same type variant*

```
FMUL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;

## C7.3.125 FNMSUB

Floating-point negated fused multiply-subtract (scalar) : `Vd = (-Va) + Vn*Vm`

### *Single-precision variant*

Applies when `type = 00`.

```
FNMSUB <Sd>, <Sn>, <Sm>, <Sa>
```

### *Double-precision variant*

Applies when `type = 01`.

```
FNMSUB <Dd>, <Dn>, <Dm>, <Da>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer a = UInt(Ra);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

boolean opa_neg = (o1 == '1');
boolean op1_neg = (o0 != o1);
```

## Assembler symbols

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.

`<Da>` Is the 64-bit name of the third SIMD&FP source register holding the minuend, encoded in the "Ra" field.

`<Sd>` Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

`<Sn>` Is the 32-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.

`<Sm>` Is the 32-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.

`<Sa>` Is the 32-bit name of the third SIMD&FP source register holding the minuend, encoded in the "Ra" field.

## C7.3.126 FNMUL

Floating-point multiply-negate (scalar) : `Vd = -(Vn * Vm)`

### *Single-precision variant*

Applies when `type = 00`.

```
FNMUL <Sd>, <Sn>, <Sm>
```

### *Double-precision variant*

Applies when `type = 01`.

```
FNMUL <Dd>, <Dn>, <Dm>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

boolean negated = (op == '1');
```

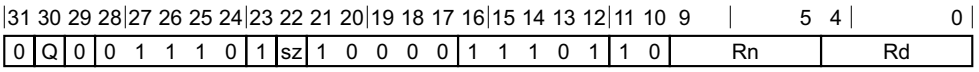
## C7.3.127 FRECPE

Floating-point reciprocal estimate

### Scalar

#### *Scalar variant*



```
FRECPE <V><d>, <V><n>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;
```

### Vector

#### *Vector variant*

```
FRECPE <Vd>.<T>, <Vn>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

S when `sz = 0`

D when `sz = 1`

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when `sz = 0, Q = 0`

4S when `sz = 0, Q = 1`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

2D when sz = 1, Q = 1

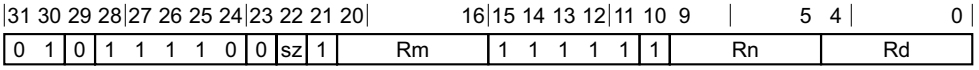
The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPRecipEstimate(element, FPCR);



V[d] = result;
```

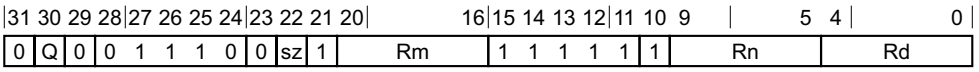
## C7.3.128 FRECPS

Floating-point reciprocal step

### Scalar



#### *Scalar variant*

```
FRECPS <V><d>, <V><n>, <V><m>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;
```

### Vector

#### *Vector variant*

```
FRECPS <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

4S when sz = 0, Q = 1

2D when sz = 1, Q = 1

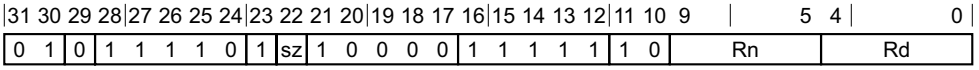
The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;



for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPRecipStepFused(element1, element2);

V[d] = result;
```

## C7.3.129 FRECPX

Floating-point reciprocal exponent (scalar)

### *Scalar variant*

```
FRECPX <V><d>, <V><n>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

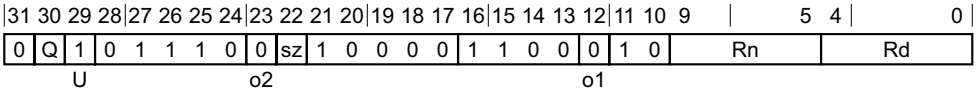
- S when sz = 0
- D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPRecpX(element, FPCR);

V[d] = result;
```

## C7.3.130 FRINTA (vector)

Floating-point round to integral, to nearest with ties to away (vector)

### *Vector variant*

```
FRINTA <Vd>.<T>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean exact = FALSE;
FPRounding rounding;
case U:o1:o2 of
    when '0xx' rounding = FPDecodeRounding(o1:o2);
    when '100' rounding = FPRounding_TIEAWAY;
    when '101' UnallocatedEncoding();
    when '110' rounding = FPRoundingMode(FPCR); exact = TRUE;
    when '111' rounding = FPRoundingMode(FPCR);
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

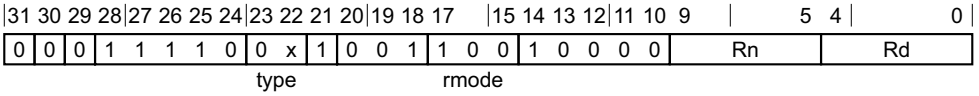
- 2S when `sz = 0, Q = 0`
- 4S when `sz = 0, Q = 1`
- 2D when `sz = 1, Q = 1`

The encoding `sz = 1, Q = 0` is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPRoundInt(element, FPCR, rounding, exact);

V[d] = result;
```

## C7.3.131 FRINTA (scalar)

Floating-point round to integral, to nearest with ties to away (scalar) : `Vd = roundToIntegralTiesToAway(Vn)`

### *Single-precision variant*

Applies when `type = 00`.

```
FRINTA <Sd>, <Sn>
```

### *Double-precision variant*

Applies when `type = 01`.

```
FRINTA <Dd>, <Dn>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

boolean exact = FALSE;
FPRounding rounding;
case rmode of
    when '0xx' rounding = FPDecodeRounding(rmode<1:0>);
    when '100' rounding = FPRounding_TIEAWAY;
    when '101' UnallocatedEncoding();
    when '110' rounding = FPRoundingMode(FPCR); exact = TRUE;
    when '111' rounding = FPRoundingMode(FPCR);
```

## Assembler symbols

| | |
|---|---|
| <Dd> | Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |

## C7.3.132 FRINTI (vector)

Floating-point round to integral, using current rounding mode (vector)

### *Vector variant*

```
FRINTI <Vd>.<T>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean exact = FALSE;
FPRounding rounding;
case U:o1:o2 of
    when '0xx' rounding = FPDecodeRounding(o1:o2);
    when '100' rounding = FPRounding_TIEAWAY;
    when '101' UnallocatedEncoding();
    when '110' rounding = FPRoundingMode(FPCR); exact = TRUE;
    when '111' rounding = FPRoundingMode(FPCR);
```

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when `sz = 0, Q = 0`

4S when `sz = 0, Q = 1`

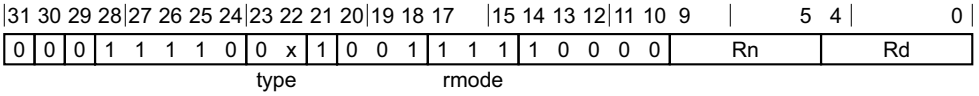
2D when `sz = 1, Q = 1`

The encoding `sz = 1, Q = 0` is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

### Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPRoundInt(element, FPCR, rounding, exact);

V[d] = result;
```

## C7.3.138 FRINTP (vector)

Floating-point round to integral, toward positive infinity (vector)

### *Vector variant*

```
FRINTP <Vd>.<T>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean exact = FALSE;
FPRounding rounding;
case U:o1:o2 of
    when '0xx' rounding = FPDecodeRounding(o1:o2);
    when '100' rounding = FPRounding_TIEAWAY;
    when '101' UnallocatedEncoding();
    when '110' rounding = FPRoundingMode(FPCR); exact = TRUE;
    when '111' rounding = FPRoundingMode(FPCR);
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

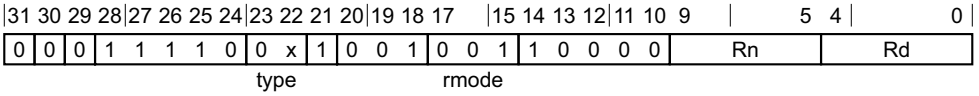
- 2S when `sz = 0, Q = 0`
- 4S when `sz = 0, Q = 1`
- 2D when `sz = 1, Q = 1`

The encoding `sz = 1, Q = 0` is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPRoundInt(element, FPCR, rounding, exact);

V[d] = result;
```

### C7.3.139 FRINTP (scalar)

Floating-point round to integral, toward positive infinity (scalar) : `Vd = roundToIntegralTowardPositive(Vn)`

#### *Single-precision variant*

Applies when `type = 00`.

```
FRINTP <Sd>, <Sn>
```

#### *Double-precision variant*

Applies when `type = 01`.

```
FRINTP <Dd>, <Dn>
```

#### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

boolean exact = FALSE;
FPRounding rounding;
case rmode of
    when '0xx' rounding = FPDecodeRounding(rmode<1:0>);
    when '100' rounding = FPRounding_TIEAWAY;
    when '101' UnallocatedEncoding();
    when '110' rounding = FPRoundingMode(FPCR); exact = TRUE;
    when '111' rounding = FPRoundingMode(FPCR);
```

### Assembler symbols

| | |
|---|---|
| <Dd> | Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |
| <Dn> | Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field. |

## C7.3.142 FRINTZ (vector)

Floating-point round to integral, toward zero (vector)

### *Vector variant*

```
FRINTZ <Vd>.<T>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean exact = FALSE;
FPRounding rounding;
case U:o1:o2 of
    when '0xx' rounding = FPDecodeRounding(o1:o2);
    when '100' rounding = FPRounding_TIEAWAY;
    when '101' UnallocatedEncoding();
    when '110' rounding = FPRoundingMode(FPCR); exact = TRUE;
    when '111' rounding = FPRoundingMode(FPCR);
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

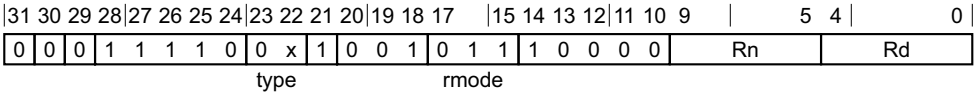
- 2S when `sz = 0, Q = 0`
- 4S when `sz = 0, Q = 1`
- 2D when `sz = 1, Q = 1`

The encoding `sz = 1, Q = 0` is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1

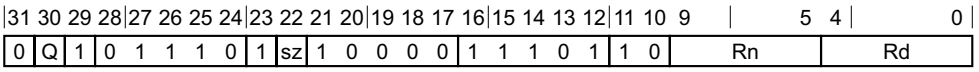
## C7.3.144 FRSQRTE

Floating-point reciprocal square root estimate

### Scalar

#### *Scalar variant*



```
FRSQRTE <V><d>, <V><n>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;
```

### Vector

#### *Vector variant*

```
FRSQRTE <Vd>.<T>, <Vn>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

4S when sz = 0, Q = 1

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];

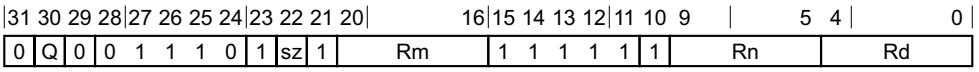
## C7.3.145 FRSQRTS

Floating-point reciprocal square root step

### Scalar



#### *Scalar variant*

```
FRSQRTS <V><d>, <V><n>, <V><m>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 32 << UInt(sz);
integer datasize = esize;
integer elements = 1;
```

### Vector

#### *Vector variant*

```
FRSQRTS <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

#### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

### Assembler symbols

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

D when sz = 1

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

4S when sz = 0, Q = 1

2D when sz = 1, Q = 1

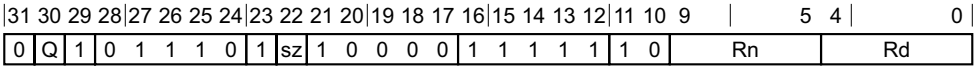
The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;



for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPRSqrtStepFused(element1, element2);

V[d] = result;
```

## C7.3.146 FSQRT (vector)

Floating-point square root (vector)

### *Vector variant*

```
FSQRT <Vd>.<T>, <Vn>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

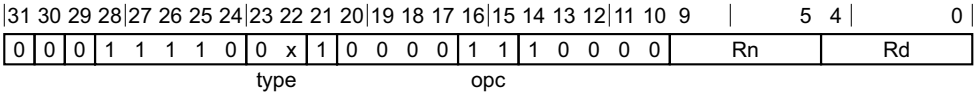
- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;



for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPSqrt(element, FPCR);

V[d] = result;
```

## C7.3.148 FSUB (vector)

Floating-point subtract (vector)

### *Three registers of the same type variant*

```
FSUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean abs = (U == '1');
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 2S when `sz = 0, Q = 0`
- 4S when `sz = 0, Q = 1`
- 2D when `sz = 1, Q = 1`

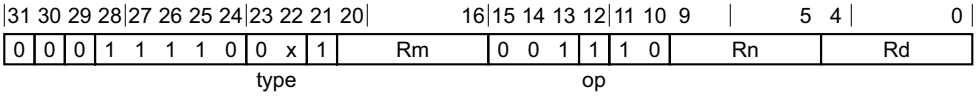
The encoding `sz = 1, Q = 0` is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
bits(esize) diff;



for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    diff = FPSub(element1, element2, FPCR);
    Elem[result, e, esize] = if abs then FPAbs(diff) else diff;

V[d] = result;
```

Non-Confidential - Beta

## C7.3.149 FSUB (scalar)

Floating-point subtract (scalar) : `Vd = Vn - Vm`

### *Single-precision variant*

Applies when `type = 00`.

```
FSUB <Sd>, <Sn>, <Sm>
```

### *Double-precision variant*

Applies when `type = 01`.

```
FSUB <Dd>, <Dn>, <Dm>
```

### *Decode for all variants of this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize;
case type of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '1x' UnallocatedEncoding();

boolean sub_op = (op == '1');
```

## Assembler symbols

| | |
|---|---|
| `<Dd>` | Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |
| `<Dn>` | Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field. |
| `<Dm>` | Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field. |
| `<Sd>` | Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field. |
| `<Sn>` | Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field. |
| `<Sm>` | Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field. |

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) result;
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];

if sub_op then
    result = FPSub(operand1, operand2, FPCR);

## C7.3.150 INS (element)

Insert vector element from another vector element

This instruction is used by the alias MOV (element). The alias is always the preferred disassembly.

### *Advanced SIMD variant*

```
INS <Vd>.<Ts>[<index1>], <Vn>.<Ts>[<index2>]
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);
if size > 3 then UnallocatedEncoding();

integer dst_index = UInt(imm5<4:size+1>);
integer src_index = UInt(imm4<3:size>);
integer idxdsize = if imm4<3> == '1' then 128 else 64;
// imm4<size-1:0> is IGNORED

integer esize = 8 << size;
```

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ts> Is an element size specifier, encoded in the "imm5" field. It can have the following values:

| | |
|---|---|
| B | when imm5 = xxxx1 |
| H | when imm5 = xxx10 |
| S | when imm5 = xx100 |
| D | when imm5 = x1000 |

The encoding imm5 = x0000 is reserved.

<index1> Is the destination element index encoded in the "imm5" field. It can have the following values:

| | |
|---|---|
| imm5<4:1> | when imm5 = xxxx1 |
| imm5<4:2> | when imm5 = xxx10 |
| imm5<4:3> | when imm5 = xx100 |
| imm5<4> | when imm5 = x1000 |

The encoding imm5 = x0000 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<index2> Is the source element index encoded in the "imm5:imm4" field. It can have the following values:

| | |
|---|---|
| imm4<3:0> | when imm5 = xxxx1 |
| imm4<3:1> | when imm5 = xxx10 |
| imm4<3:2> | when imm5 = xx100 |
| imm4<3> | when imm5 = x1000 |

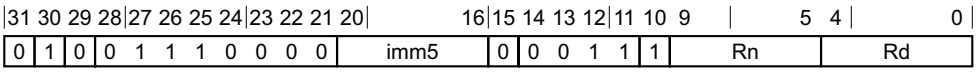
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The encoding `imm5 = x0000` is reserved.

Unspecified bits in "imm4" are ignored but should be set to zero by an assembler.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(idxdsize) operand = V[n];
bits(128) result;



result = V[d];

## C7.3.151 INS (general)

Insert vector element from general-purpose register

This instruction is used by the alias MOV (from general). The alias is always the preferred disassembly.

### *Advanced SIMD variant*

```
INS <Vd>.<Ts>[<index>], <R><n>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);

if size > 3 then UnallocatedEncoding();
integer index = UInt(imm5<4:size+1>);

integer esize = 8 << size;
integer datasize = 128;
```

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ts> Is an element size specifier, encoded in the "imm5" field. It can have the following values:

| | |
|---|---|
| B | when imm5 = xxxx1 |
| H | when imm5 = xxx10 |
| S | when imm5 = xx100 |
| D | when imm5 = x1000 |

The encoding imm5 = x0000 is reserved.

<index> Is the element index encoded in the "imm5" field. It can have the following values:

| | |
|---|---|
| imm5<4:1> | when imm5 = xxxx1 |
| imm5<4:2> | when imm5 = xxx10 |
| imm5<4:3> | when imm5 = xx100 |
| imm5<4> | when imm5 = x1000 |

The encoding imm5 = x0000 is reserved.

<R> Is the width specifier for the general-purpose source register, encoded in the "imm5" field. It can have the following values:

| | |
|---|---|
| W | when imm5 = xxxx1 |
| W | when imm5 = xxx10 |
| W | when imm5 = xx100 |
| X | when imm5 = x1000 |

The encoding imm5 = x0000 is reserved.

<n> Is the number [0-30] of the general-purpose source register or ZR (31), encoded in the "Rn" field.

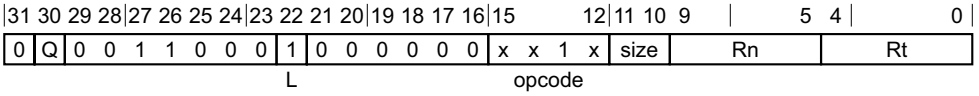
Non-Confidential - Beta

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(esize) element = X[n];
bits(datasize) result;



result = V[d];
Elem[result, index, esize] = element;
V[d] = result;
```

## C7.3.152 LD1 (multiple structures)

Load multiple 1-element structures to one, two, three or four registers

### No offset

#### *One register variant*

Applies when `opcode = 0111`.

```
LD1 { <Vt>.<T> }, [<Xn|SP>]
```

#### *Two registers variant*

Applies when `opcode = 1010`.

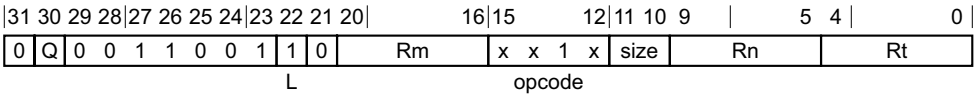
```
LD1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]
```

#### *Three registers variant*

Applies when `opcode = 0110`.

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>]
```

#### *Four registers variant*



Applies when `opcode = 0010`.

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]
```

#### *Decode for all variants of this encoding*

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
```

### Post-index

#### *One register, immediate offset variant*

Applies when `Rm = 11111 && opcode = 0111`.

```
LD1 { <Vt>.<T> }, [<Xn|SP>], <imm>
```

#### *One register, register offset variant*

Applies when `Rm != 11111 && opcode = 0111`.

```
LD1 { <Vt>.<T> }, [<Xn|SP>], <Xm>
```

#### *Two registers, immediate offset variant*

Applies when `Rm = 11111 && opcode = 1010`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
LD1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>
```

#### *Two registers, register offset variant*

Applies when `Rm != 11111 && opcode = 1010`.

```
LD1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>
```

#### *Three registers, immediate offset variant*

Applies when `Rm = 11111 && opcode = 0110`.

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <imm>
```

#### *Three registers, register offset variant*

Applies when `Rm != 11111 && opcode = 0110`.

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>
```

#### *Four registers, immediate offset variant*

Applies when `Rm = 11111 && opcode = 0010`.

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>
```

#### *Four registers, register offset variant*

Applies when `Rm != 11111 && opcode = 0010`.

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>
```

#### *Decode for all variants of this encoding*

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
```

### Assembler symbols

`<Vt>` Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

`<T>` Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

| | |
|---|---|
| `8B` | when `size = 00, Q = 0` |
| `16B` | when `size = 00, Q = 1` |
| `4H` | when `size = 01, Q = 0` |
| `8H` | when `size = 01, Q = 1` |
| `2S` | when `size = 10, Q = 0` |
| `4S` | when `size = 10, Q = 1` |
| `1D` | when `size = 11, Q = 0` |
| `2D` | when `size = 11, Q = 1` |

`<Vt2>` Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

`<Vt3>` Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

`<Vt4>` Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<imm> For the one register, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:

#8 when Q = 0

#16 when Q = 1

For the two registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:

#16 when Q = 0

#32 when Q = 1

For the three registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:

#24 when Q = 0

#48 when Q = 1

For the four registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:

#32 when Q = 0

#64 when Q = 1

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

## Shared decode for all encodings

```
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer datasize = if Q == '1' then 128 else 64;
integer esize = 8 << UInt(size);
integer elements = datasize DIV esize;

integer rpt;    // number of iterations
integer selem;  // structure elements

case opcode of
    when '0000' rpt = 1; selem = 4;     // LD/ST4 (4 registers)
    when '0010' rpt = 4; selem = 1;     // LD/ST1 (4 registers)
    when '0100' rpt = 1; selem = 3;     // LD/ST3 (3 registers)
    when '0110' rpt = 3; selem = 1;     // LD/ST1 (3 registers)
    when '0111' rpt = 1; selem = 1;     // LD/ST1 (1 register)
    when '1000' rpt = 1; selem = 2;     // LD/ST2 (2 registers)
    when '1010' rpt = 2; selem = 1;     // LD/ST1 (2 registers)
    otherwise UnallocatedEncoding();

// .1D format only permitted with LD1 & ST1
if size:Q == '110' && selem != 1 then ReservedValue();
```

## Operation for all encodings

```
CheckFPAdvSIMDEnabled64();

2D when size = 11, Q = 1

The encoding size = 11, Q = 0 is reserved.

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in the "Q" field. It can have the following values:

#16 when Q = 0

#32 when Q = 1

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

## Shared decode for all encodings

```
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer datasize = if Q == '1' then 128 else 64;
integer esize = 8 << UInt(size);
integer elements = datasize DIV esize;

integer rpt;    // number of iterations
integer selem;  // structure elements

case opcode of
    when '0000' rpt = 1; selem = 4;     // LD/ST4 (4 registers)

## C7.3.156 LD2 (single structure)

Load single 2-element structure to one lane of two registers

### No offset

#### *8-bit variant*

Applies when `opcode = 000`.

```
LD2 { <Vt>.B, <Vt2>.B }[<index>], [<Xn|SP>]
```

#### *16-bit variant*

Applies when `opcode = 010 && size = x0`.

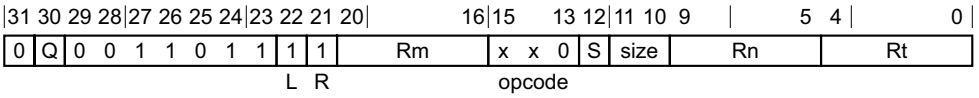
```
LD2 { <Vt>.H, <Vt2>.H }[<index>], [<Xn|SP>]
```

#### *32-bit variant*

Applies when `opcode = 100 && size = 00`.

```
LD2 { <Vt>.S, <Vt2>.S }[<index>], [<Xn|SP>]
```

#### *64-bit variant*



Applies when `opcode = 100 && S = 0 && size = 01`.

```
LD2 { <Vt>.D, <Vt2>.D }[<index>], [<Xn|SP>]
```

#### *Decode for all variants of this encoding*

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
```

### Post-index

#### *8-bit, immediate offset variant*

Applies when `Rm = 11111 && opcode = 000`.

```
LD2 { <Vt>.B, <Vt2>.B }[<index>], [<Xn|SP>], #2
```

#### *8-bit, register offset variant*

Applies when `Rm != 11111 && opcode = 000`.

```

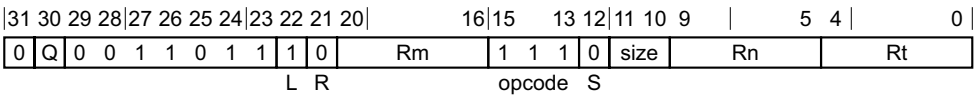
## C7.3.160 LD3R

Load single 3-element structure and replicate to all lanes of three registers

### No offset



#### *No offset variant*

```
LD3R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>]
```

#### *Decode for this encoding*

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
```

### Post-index

#### *Immediate offset variant*

Applies when `Rm = 11111`.

```
LD3R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <imm>
```

#### *Register offset variant*

Applies when `Rm != 11111`.

```
LD3R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>
```

#### *Decode for all variants of this encoding*

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
```

### Assembler symbols

`<Vt>` Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

`<T>` Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

| | |
|---|---|
| `8B` | when `size = 00, Q = 0` |
| `16B` | when `size = 00, Q = 1` |
| `4H` | when `size = 01, Q = 0` |
| `8H` | when `size = 01, Q = 1` |
| `2S` | when `size = 10, Q = 0` |
| `4S` | when `size = 10, Q = 1` |

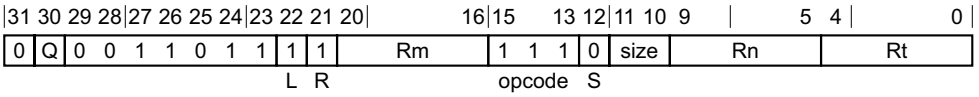
## C7.3.163 LD4R

Load single 4-element structure and replicate to all lanes of four registers

### No offset



#### *No offset variant*

```
LD4R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]
```

#### *Decode for this encoding*

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
```

### Post-index

#### *Immediate offset variant*

Applies when `Rm = 11111`.

```
LD4R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>
```

#### *Register offset variant*

Applies when `Rm != 11111`.

```
LD4R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>
```

#### *Decode for all variants of this encoding*

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
```

### Assembler symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

| | |
|---|---|
| 8B | when `size = 00, Q = 0` |
| 16B | when `size = 00, Q = 1` |
| 4H | when `size = 01, Q = 0` |
| 8H | when `size = 01, Q = 1` |
| 2S | when `size = 10, Q = 0` |
| 4S | when `size = 10, Q = 1` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1D when size = 11, Q = 0

2D when size = 11, Q = 1

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

<Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in the "size" field. It can have the following values:

#4 when size = 00

#8 when size = 01

#16 when size = 10

#32 when size = 11

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

## Shared decode for all encodings

```
integer scale = UInt(opcode<2:1>);
integer selem = UInt(opcode<0>:R) + 1;

## C7.3.168 LDR (register, SIMD&FP)

Load SIMD&FP register (register offset)

### *8-bit variant*

Applies when `size = 00 && opc = 01 && option != 011`.

```
LDR <Bt>, [<Xn|SP>, (<Wm>|<Xm>), <extend> {<amount>}]
```

### *8-bit variant*

Applies when `size = 00 && opc = 01 && option = 011`.

```
LDR <Bt>, [<Xn|SP>, <Xm>{, LSL <amount>}]
```

### *16-bit variant*

Applies when `size = 01 && opc = 01`.

```
LDR <Ht>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### *32-bit variant*

Applies when `size = 10 && opc = 01`.

```
LDR <St>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### *64-bit variant*

Applies when `size = 11 && opc = 01`.

```
LDR <Dt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### *128-bit variant*

Applies when `size = 00 && opc = 11`.

```
LDR <Qt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

### *Decode for all variants of this encoding*

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(opc<1>:size);
if scale > 4 then UnallocatedEncoding();
if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

## Assembler symbols

| | |
|---|---|
| `<Bt>` | Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field. |
| `<Dt>` | Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field. |
| `<Ht>` | Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<Qt>` Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

`<St>` Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

`<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

`<Wm>` When `option<0>` is set to `0`, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

`<Xm>` When `option<0>` is set to `1`, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

`<extend>` For the 8-bit variant: is the index extend specifier, encoded in the "option" field. It can have the following values:

`UXTW` when `option = 010`

`SXTW` when `option = 110`

`SXTX` when `option = 111`

For the 128-bit, 16-bit, 32-bit and 64-bit variant: is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:

`UXTW` when `option = 010`

`LSL` when `option = 011`

`SXTW` when `option = 110`

`SXTX` when `option = 111`

`<amount>` For the 8-bit variant: is the index shift amount, it must be `#0`, encoded in "S" as `0` if omitted, or as `1` if present.

For the 16-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

`#0` when `S = 0`

`#1` when `S = 1`

For the 32-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

`#0` when `S = 0`

`#2` when `S = 1`

For the 64-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

`#0` when `S = 0`

`#3` when `S = 1`

For the 128-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

`#0` when `S = 0`

`#4` when `S = 1`

## Shared decode for all encodings

## C7.3.174 MOV (scalar)

Move vector element to scalar

This instruction is an alias of the DUP (element) instruction. This means that:

- The encodings in this description are named to match the encodings of DUP (element).
- The description of DUP (element) gives the operational pseudocode for this instruction.

### *Scalar variant*

```
MOV <V><d>, <Vn>.<T>[<index>]
```

is equivalent to

```
DUP  <V><d>, <Vn>.<T>[<index>]
```

and is always the preferred disassembly.

### Assembler symbols

<V> Is the destination width specifier, encoded in the "imm5" field. It can have the following values:

- B when imm5 = xxxx1
- H when imm5 = xxx10
- S when imm5 = xx100
- D when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is the element width specifier, encoded in the "imm5" field. It can have the following values:

- B when imm5 = xxxx1
- H when imm5 = xxx10
- S when imm5 = xx100
- D when imm5 = x1000

The encoding imm5 = x0000 is reserved.

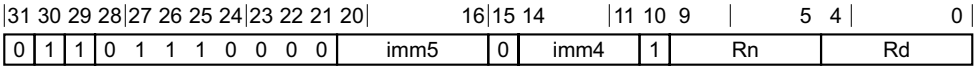
<index> Is the element index encoded in the "imm5" field. It can have the following values:

- imm5<4:1> when imm5 = xxxx1
- imm5<4:2> when imm5 = xxx10
- imm5<4:3> when imm5 = xx100
- imm5<4> when imm5 = x1000

The encoding imm5 = x0000 is reserved.

### Operation

The description of DUP (element) gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## C7.3.175 MOV (element)

Move vector element to another vector element

This instruction is an alias of the INS (element) instruction. This means that:

- The encodings in this description are named to match the encodings of INS (element).
- The description of INS (element) gives the operational pseudocode for this instruction.

### *Advanced SIMD variant*

```
MOV <Vd>.<Ts>[<index1>], <Vn>.<Ts>[<index2>]
```

is equivalent to

```
INS  <Vd>.<Ts>[<index1>], <Vn>.<Ts>[<index2>]
```

and is always the preferred disassembly.

### Assembler symbols

`<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

`<Ts>` Is an element size specifier, encoded in the "imm5" field. It can have the following values:

- `B` when `imm5 = xxxx1`
- `H` when `imm5 = xxx10`
- `S` when `imm5 = xx100`
- `D` when `imm5 = x1000`

The encoding `imm5 = x0000` is reserved.

`<index1>` Is the destination element index encoded in the "imm5" field. It can have the following values:

- `imm5<4:1>` when `imm5 = xxxx1`
- `imm5<4:2>` when `imm5 = xxx10`
- `imm5<4:3>` when `imm5 = xx100`
- `imm5<4>` when `imm5 = x1000`

The encoding `imm5 = x0000` is reserved.

`<Vn>` Is the name of the SIMD&FP source register, encoded in the "Rn" field.

`<index2>` Is the source element index encoded in the "imm5:imm4" field. It can have the following values:

- `imm4<3:0>` when `imm5 = xxxx1`
- `imm4<3:1>` when `imm5 = xxx10`
- `imm4<3:2>` when `imm5 = xx100`
- `imm4<3>` when `imm5 = x1000`

The encoding `imm5 = x0000` is reserved.

Unspecified bits in "imm4" are ignored but should be set to zero by an assembler.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Operation

The description of INS (element) gives the operational pseudocode for this instruction.

## C7.3.176 MOV (from general)

Move general-purpose register to a vector element

This instruction is an alias of the INS (general) instruction. This means that:

- The encodings in this description are named to match the encodings of INS (general).
- The description of INS (general) gives the operational pseudocode for this instruction.

### *Advanced SIMD variant*

```
MOV <Vd>.<Ts>[<index>], <R><n>
```

is equivalent to

```
INS  <Vd>.<Ts>[<index>], <R><n>
```

and is always the preferred disassembly.

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ts> Is an element size specifier, encoded in the "imm5" field. It can have the following values:

- B when imm5 = xxxx1
- H when imm5 = xxx10
- S when imm5 = xx100
- D when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<index> Is the element index encoded in the "imm5" field. It can have the following values:

- imm5<4:1> when imm5 = xxxx1
- imm5<4:2> when imm5 = xxx10
- imm5<4:3> when imm5 = xx100
- imm5<4> when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<R> Is the width specifier for the general-purpose source register, encoded in the "imm5" field. It can have the following values:

- W when imm5 = xxxx1
- W when imm5 = xxx10
- W when imm5 = xx100
- X when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<n> Is the number [0-30] of the general-purpose source register or ZR (31), encoded in the "Rn" field.

## C7.3.177 MOV (vector)

Move vector

This instruction is an alias of the ORR (vector, register) instruction. This means that:

- The encodings in this description are named to match the encodings of ORR (vector, register).
- The description of ORR (vector, register) gives the operational pseudocode for this instruction.

### *Three registers of the same type variant*

`MOV <Vd>.<T>, <Vn>.<T>`

is equivalent to

`ORR  <Vd>.<T>, <Vn>.<T>, <Vn>.<T>`

and is the preferred disassembly when `Rm == Rn`.

### Assembler symbols

`<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

`<T>` Is an arrangement specifier, encoded in the "Q" field. It can have the following values:

`8B` when `Q = 0`

`16B` when `Q = 1`

`<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

### Operation

The description of ORR (vector, register) gives the operational pseudocode for this instruction.

## C7.3.178 MOV (to general)

Move vector element to general-purpose register

This instruction is an alias of the UMOV instruction. This means that:

- The encodings in this description are named to match the encodings of UMOV.
- The description of UMOV gives the operational pseudocode for this instruction.

### *32-bit variant*

Applies when `Q = 0 && imm5 = xx100`.

```
MOV <Wd>, <Vn>.S[<index>]
```

is equivalent to

```
UMOV <Wd>, <Vn>.S[<index>]
```

and is always the preferred disassembly.

### *64-bit variant*

Applies when `Q = 1 && imm5 = x1000`.

```
MOV <Xd>, <Vn>.D[<index>]
```

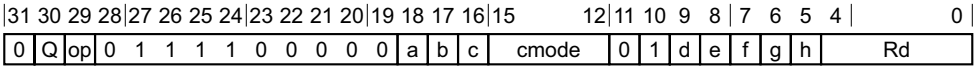
is equivalent to

```
UMOV <Xd>, <Vn>.D[<index>]
```

and is always the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<Wd>` | Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Xd>` | Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field. |
| `<Vn>` | Is the name of the SIMD&FP source register, encoded in the "Rn" field. |
| `<index>` | For the 32-bit variant: is the element index encoded in "imm5<4:3>".<br>For the 64-bit variant: is the element index encoded in "imm5<4>". |



### Operation

The description of UMOV gives the operational pseudocode for this instruction.

## C7.3.179 MOVI

Move immediate (vector)

### 8-bit variant

Applies when `op = 0 && cmode = 1110`.

```
MOVI <Vd>.<T>, #<imm8>{, LSL #0}
```

### 16-bit shifted immediate variant

Applies when `op = 0 && cmode = 10x0`.

```
MOVI <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

### 32-bit shifted immediate variant

Applies when `op = 0 && cmode = 0xx0`.

```
MOVI <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

### 32-bit shifting ones variant

Applies when `op = 0 && cmode = 110x`.

```
MOVI <Vd>.<T>, #<imm8>, MSL #<amount>
```

### 64-bit scalar variant

Applies when `Q = 0 && op = 1 && cmode = 1110`.

```
MOVI <Dd>, #<imm>
```

### 64-bit vector variant

Applies when `Q = 1 && op = 1 && cmode = 1110`.

```
MOVI <Vd>.2D, #<imm>
```

### Decode for all variants of this encoding

```
integer rd = UInt(Rd);

integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;
bits(64) imm64;

ImmediateOp operation;
case cmode:op of
    when '0xx00' operation = ImmediateOp_MOVI;
    when '0xx01' operation = ImmediateOp_MVNI;
    when '0xx10' operation = ImmediateOp_ORR;
    when '0xx11' operation = ImmediateOp_BIC;
    when '10x00' operation = ImmediateOp_MOVI;
    when '10x01' operation = ImmediateOp_MVNI;
    when '10x10' operation = ImmediateOp_ORR;
    when '10x11' operation = ImmediateOp_BIC;
    when '110x0' operation = ImmediateOp_MOVI;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
    when '110x1' operation = ImmediateOp_MVNI;
    when '1110x' operation = ImmediateOp_MOVI;
    when '11110' operation = ImmediateOp_MOVI;
    when '11111'
        // FMOV Dn,#imm is in main FP instruction set
        if Q == '0' then UnallocatedEncoding();
        operation = ImmediateOp_MOVI;

imm64 = AdvSIMDExpandImm(op, cmode, a:b:c:d:e:f:g:h);
imm = Replicate(imm64, datasize DIV 64);
```

## Assembler symbols

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<imm> Is a 64-bit immediate 'aaaaaaaabbbbbbbbccccccccddddddddeeeeeeeeffffffffgggggggghhhhhhhh', encoded in "a:b:c:d:e:f:g:h".

<T> For the 8-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

8B when Q = 0

16B when Q = 1

For the 16-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

4H when Q = 0

8H when Q = 1

For the 32-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

2S when Q = 0

4S when Q = 1

<imm8> Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".

<amount> For the 16-bit shifted immediate variant: is the shift amount encoded in the "cmode<1>" field. It can have the following values:

0 when cmode<1> = 0

8 when cmode<1> = 1

defaulting to 0 if LSL is omitted.

For the 32-bit shifted immediate variant: is the shift amount encoded in the "cmode<2:1>" field. It can have the following values:

0 when cmode<2:1> = 00

8 when cmode<2:1> = 01

16 when cmode<2:1> = 10

24 when cmode<2:1> = 11

defaulting to 0 if LSL is omitted.

For the 32-bit shifting ones variant: is the shift amount encoded in the "cmode<0>" field. It can have the following values:

8 when cmode<0> = 0

16 when cmode<0> = 1

## C7.3.180 MUL (by element)

Multiply (vector, by element)

### *Vector variant*

```
MUL <Vd>.<T>, <Vn>.<T>, <Vm>.<Ts>[<index>]
```

### *Decode for this encoding*

```
integer idxdsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L);   Rmhi = M;
    otherwise UnallocatedEncoding();

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

4H when size = 01, Q = 0

8H when size = 01, Q = 1

2S when size = 10, Q = 0

4S when size = 10, Q = 1

The following encodings are reserved:

- size = 00, Q = x.
- size = 11, Q = x.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:

0:Rm when size = 01

M:Rm when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Restricted to V0-V15 when element size <Ts> is H.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Ts> Is an element size specifier, encoded in the "size" field. It can have the following values:

H when size = 01

S when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<index> Is the element index, encoded in the "size:L:H:M" field. It can have the following values:

H:L:M when size = 01

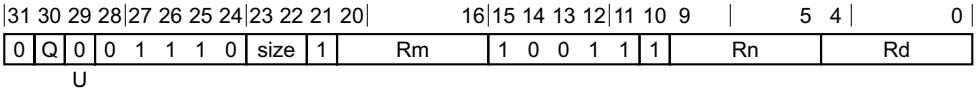
H:L when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(idxdsize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
bits(esize) product;



element2 = UInt(Elem[operand2, index, esize]);
for e = 0 to elements-1
    element1 = UInt(Elem[operand1, e, esize]);
    product = (element1 * element2)<esize-1:0>;
    Elem[result, e, esize] = product;

V[d] = result;
```

## C7.3.181 MUL (vector)

Multiply (vector)

### *Three registers of the same type variant*

```
MUL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

### *Decode for this encoding*

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if U == '1' && size != '00' then ReservedValue();
if size == '11' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean poly = (U == '1');
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
bits(esize) product;

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];

## C7.3.182 MVN

Bitwise NOT (vector)

This instruction is an alias of the NOT instruction. This means that:

- The encodings in this description are named to match the encodings of NOT.
- The description of NOT gives the operational pseudocode for this instruction.

### *Vector variant*

`MVN <Vd>.<T>, <Vn>.<T>`

is equivalent to

`NOT  <Vd>.<T>, <Vn>.<T>`

and is always the preferred disassembly.

### Assembler symbols

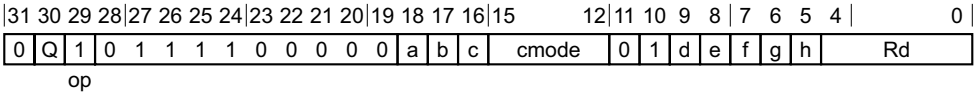
`<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

`<T>` Is an arrangement specifier, encoded in the "Q" field. It can have the following values:

`8B` when `Q = 0`

`16B` when `Q = 1`

`<Vn>` Is the name of the SIMD&FP source register, encoded in the "Rn" field.



### Operation

The description of NOT gives the operational pseudocode for this instruction.

## C7.3.183 MVNI

Move inverted immediate (vector)

### *16-bit shifted immediate variant*

Applies when `cmode = 10x0`.

```
MVNI <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

### *32-bit shifted immediate variant*

Applies when `cmode = 0xx0`.

```
MVNI <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

### *32-bit shifting ones variant*

Applies when `cmode = 110x`.

```
MVNI <Vd>.<T>, #<imm8>, MSL #<amount>
```

### *Decode for all variants of this encoding*

```
integer rd = UInt(Rd);

integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;
bits(64) imm64;

ImmediateOp operation;
case cmode:op of
    when '0xx00' operation = ImmediateOp_MOVI;
    when '0xx01' operation = ImmediateOp_MVNI;
    when '0xx10' operation = ImmediateOp_ORR;
    when '0xx11' operation = ImmediateOp_BIC;
    when '10x00' operation = ImmediateOp_MOVI;
    when '10x01' operation = ImmediateOp_MVNI;
    when '10x10' operation = ImmediateOp_ORR;
    when '10x11' operation = ImmediateOp_BIC;
    when '110x0' operation = ImmediateOp_MOVI;
    when '110x1' operation = ImmediateOp_MVNI;
    when '1110x' operation = ImmediateOp_MOVI;
    when '11110' operation = ImmediateOp_MOVI;
    when '11111'
        // FMOV Dn,#imm is in main FP instruction set
        if Q == '0' then UnallocatedEncoding();
        operation = ImmediateOp_MOVI;

imm64 = AdvSIMDExpandImm(op, cmode, a:b:c:d:e:f:g:h);
imm = Replicate(imm64, datasize DIV 64);
```

## Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<T> For the 16-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

4H when Q = 0

8H when Q = 1

For the 32-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

2S when Q = 0

4S when Q = 1

<imm8> Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".

<amount> For the 16-bit shifted immediate variant: is the shift amount encoded in the "cmode<1>" field. It can have the following values:

0 when cmode<1> = 0

8 when cmode<1> = 1

defaulting to 0 if LSL is omitted.

For the 32-bit shifted immediate variant: is the shift amount encoded in the "cmode<2:1>" field. It can have the following values:

0 when cmode<2:1> = 00

8 when cmode<2:1> = 01

16 when cmode<2:1> = 10

24 when cmode<2:1> = 11

defaulting to 0 if LSL is omitted.

For the 32-bit shifting ones variant: is the shift amount encoded in the "cmode<0>" field. It can have the following values:

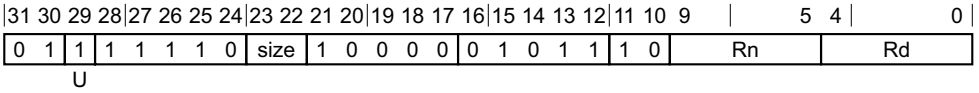
8 when cmode<0> = 0

16 when cmode<0> = 1

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand;
bits(datasize) result;

case operation of
    when ImmediateOp_MOVI
        result = imm;
    when ImmediateOp_MVNI
        result = NOT(imm);
    when ImmediateOp_ORR
        operand = V[rd];
        result = operand OR imm;
    when ImmediateOp_BIC
        operand = V[rd];
        result = operand AND NOT(imm);



V[rd] = result;
```
